

Each player has a separate tree

We simulate a game (the game itself has perfect information)

Each player can only observe their part of the game

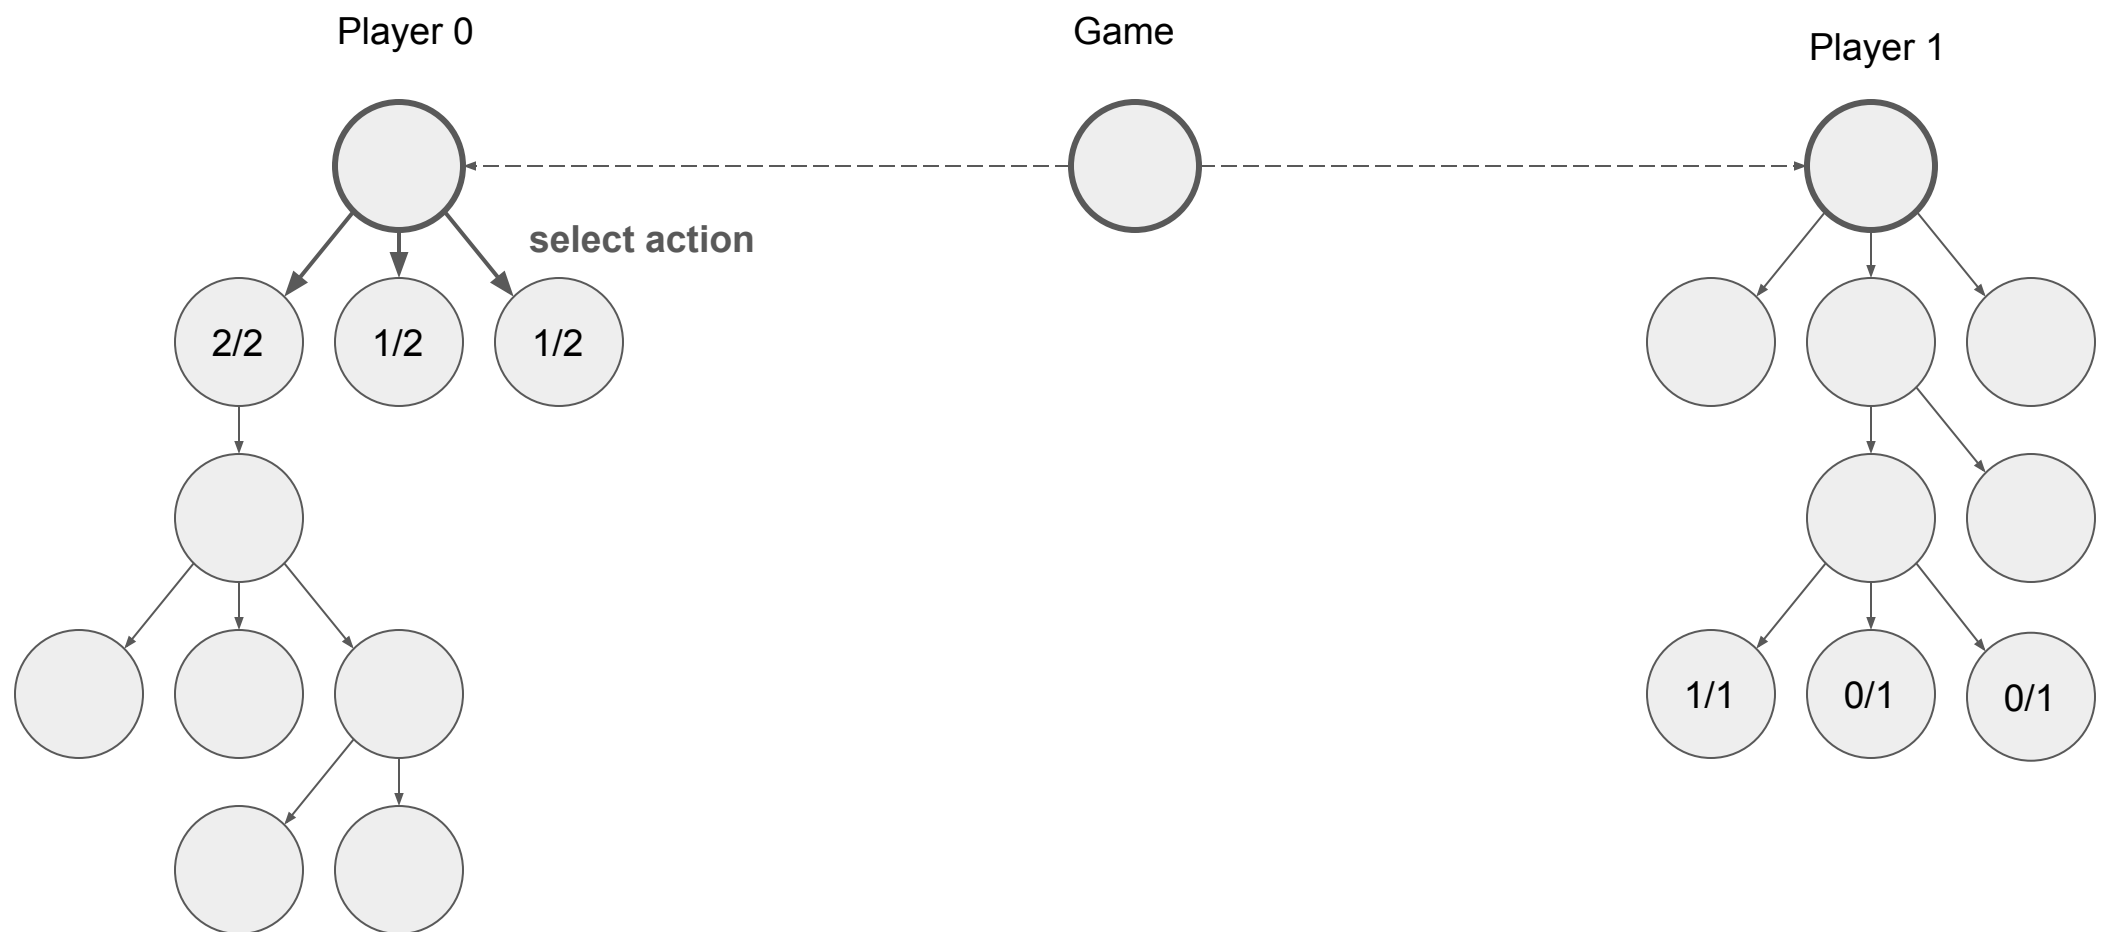

The tree distinguishes between neutral-nodes and post-action-nodes

The tree distinguishes between neutral-nodes and post-action-nodes  
 We only need to keep track of win statistics for post-action nodes.

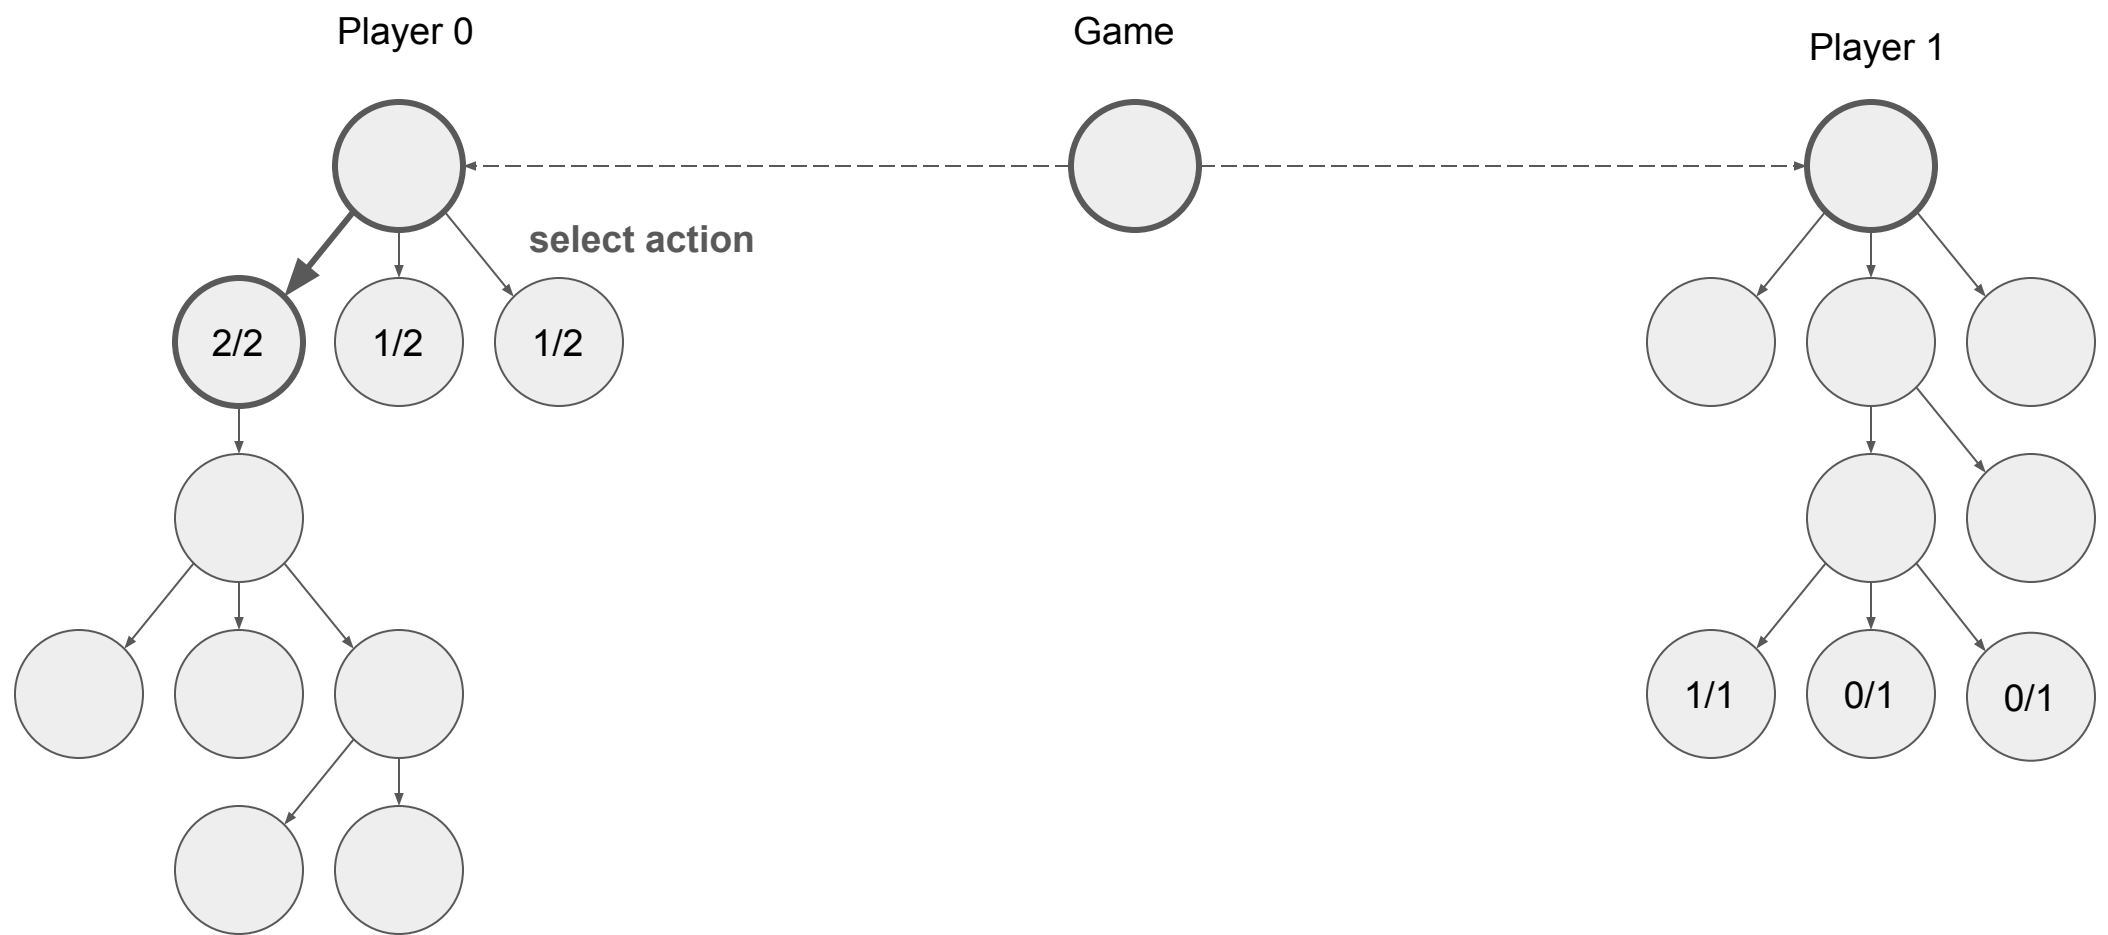

Start the game!

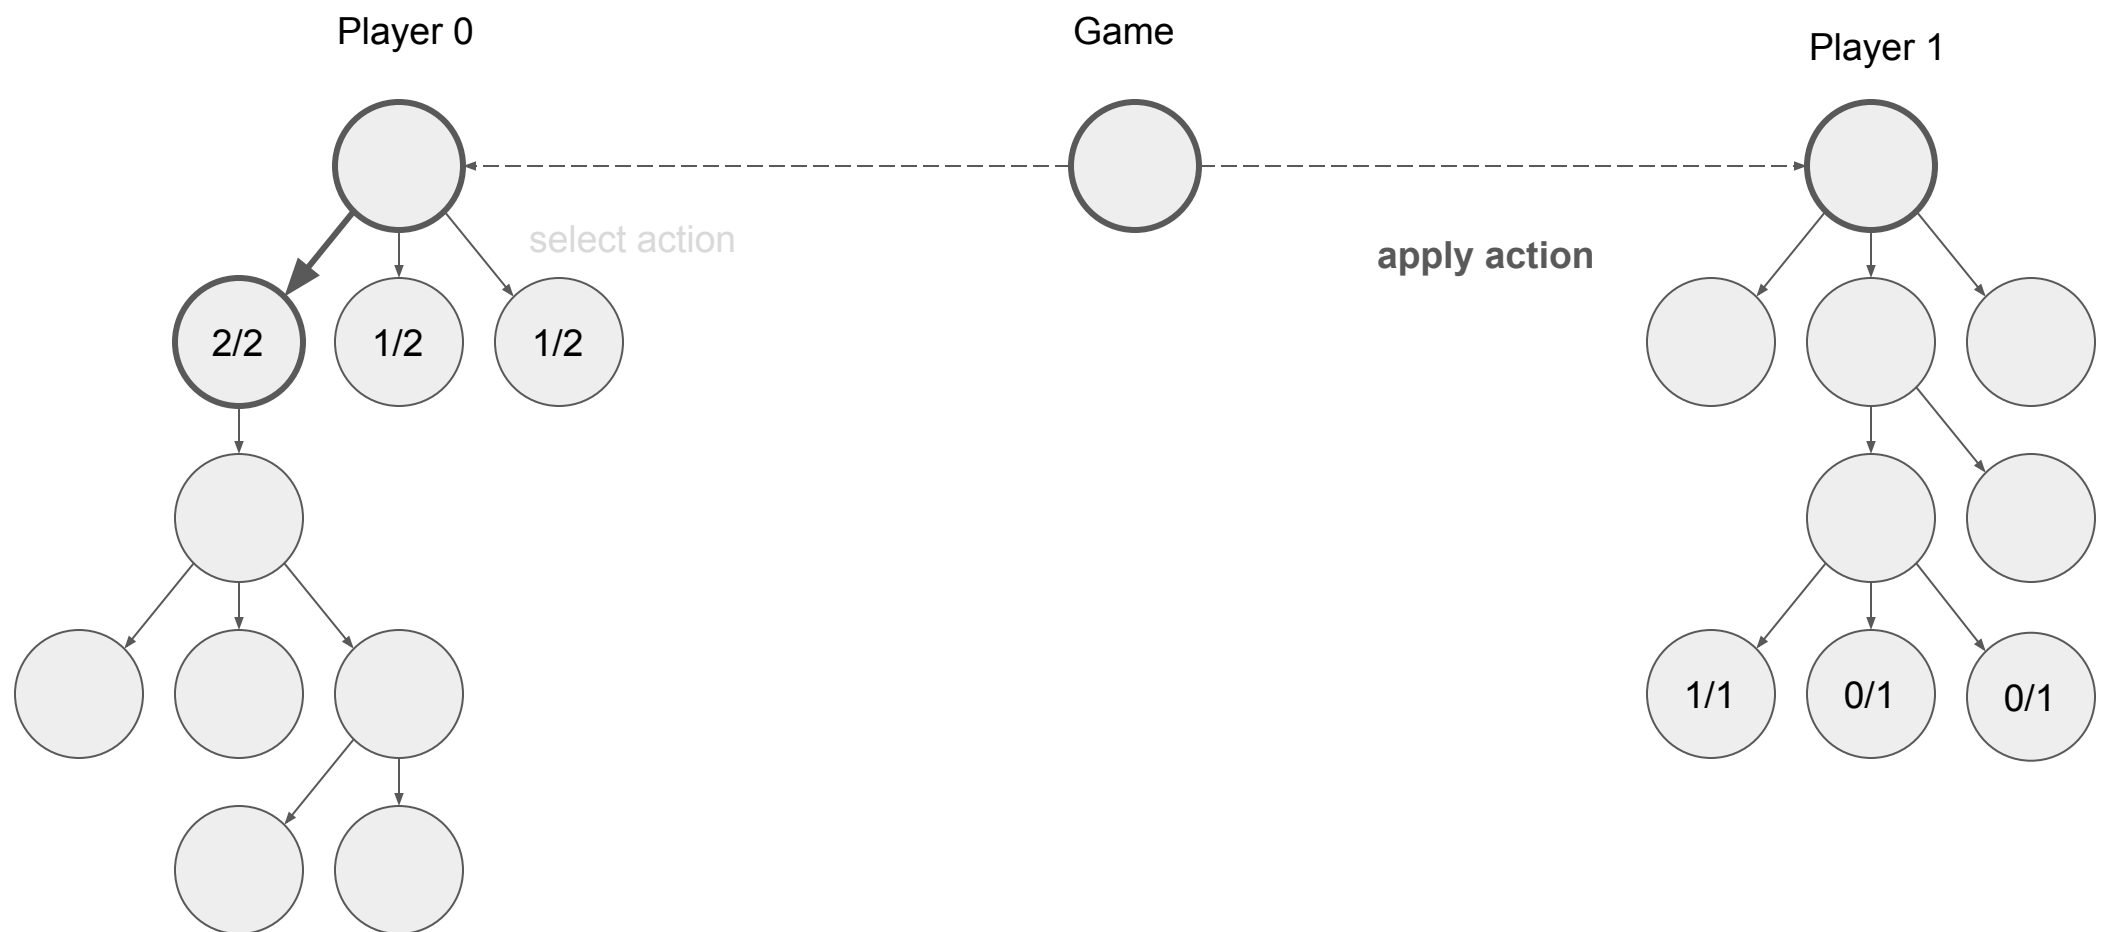

Player 0 selects the action with the highest UCB

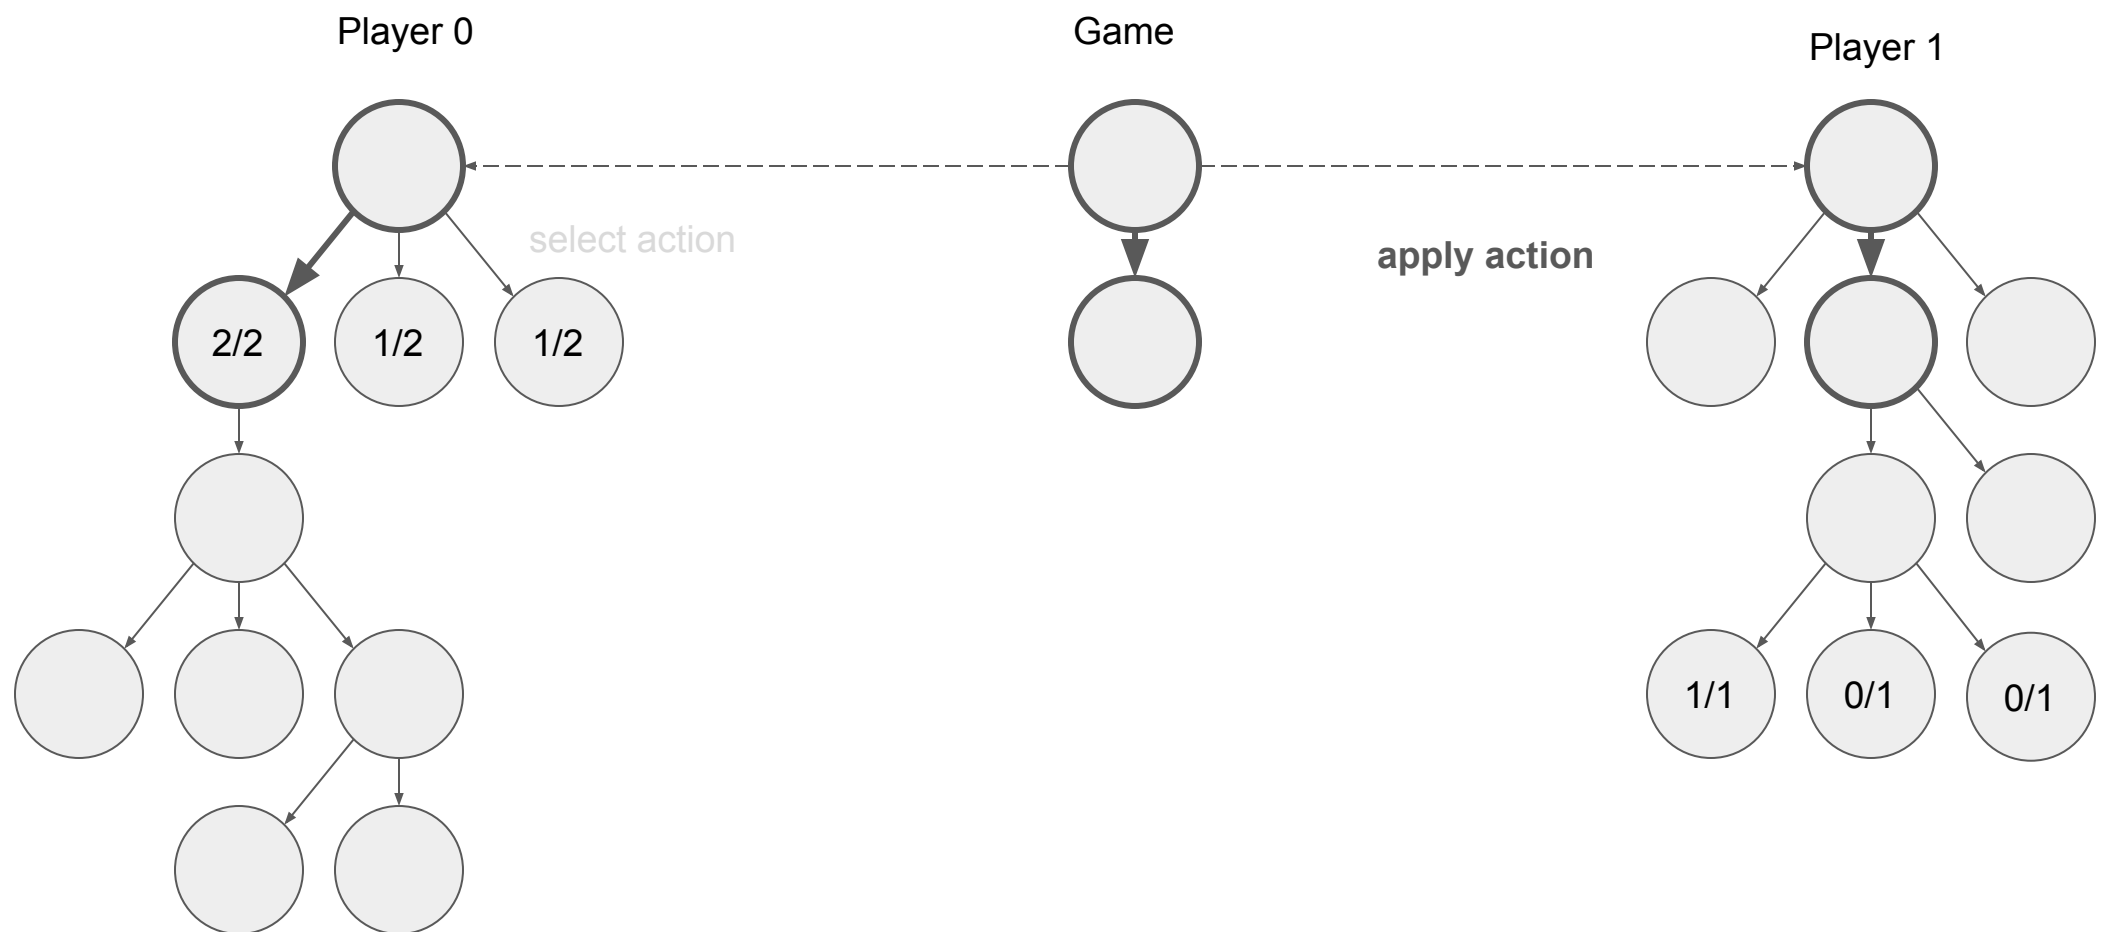

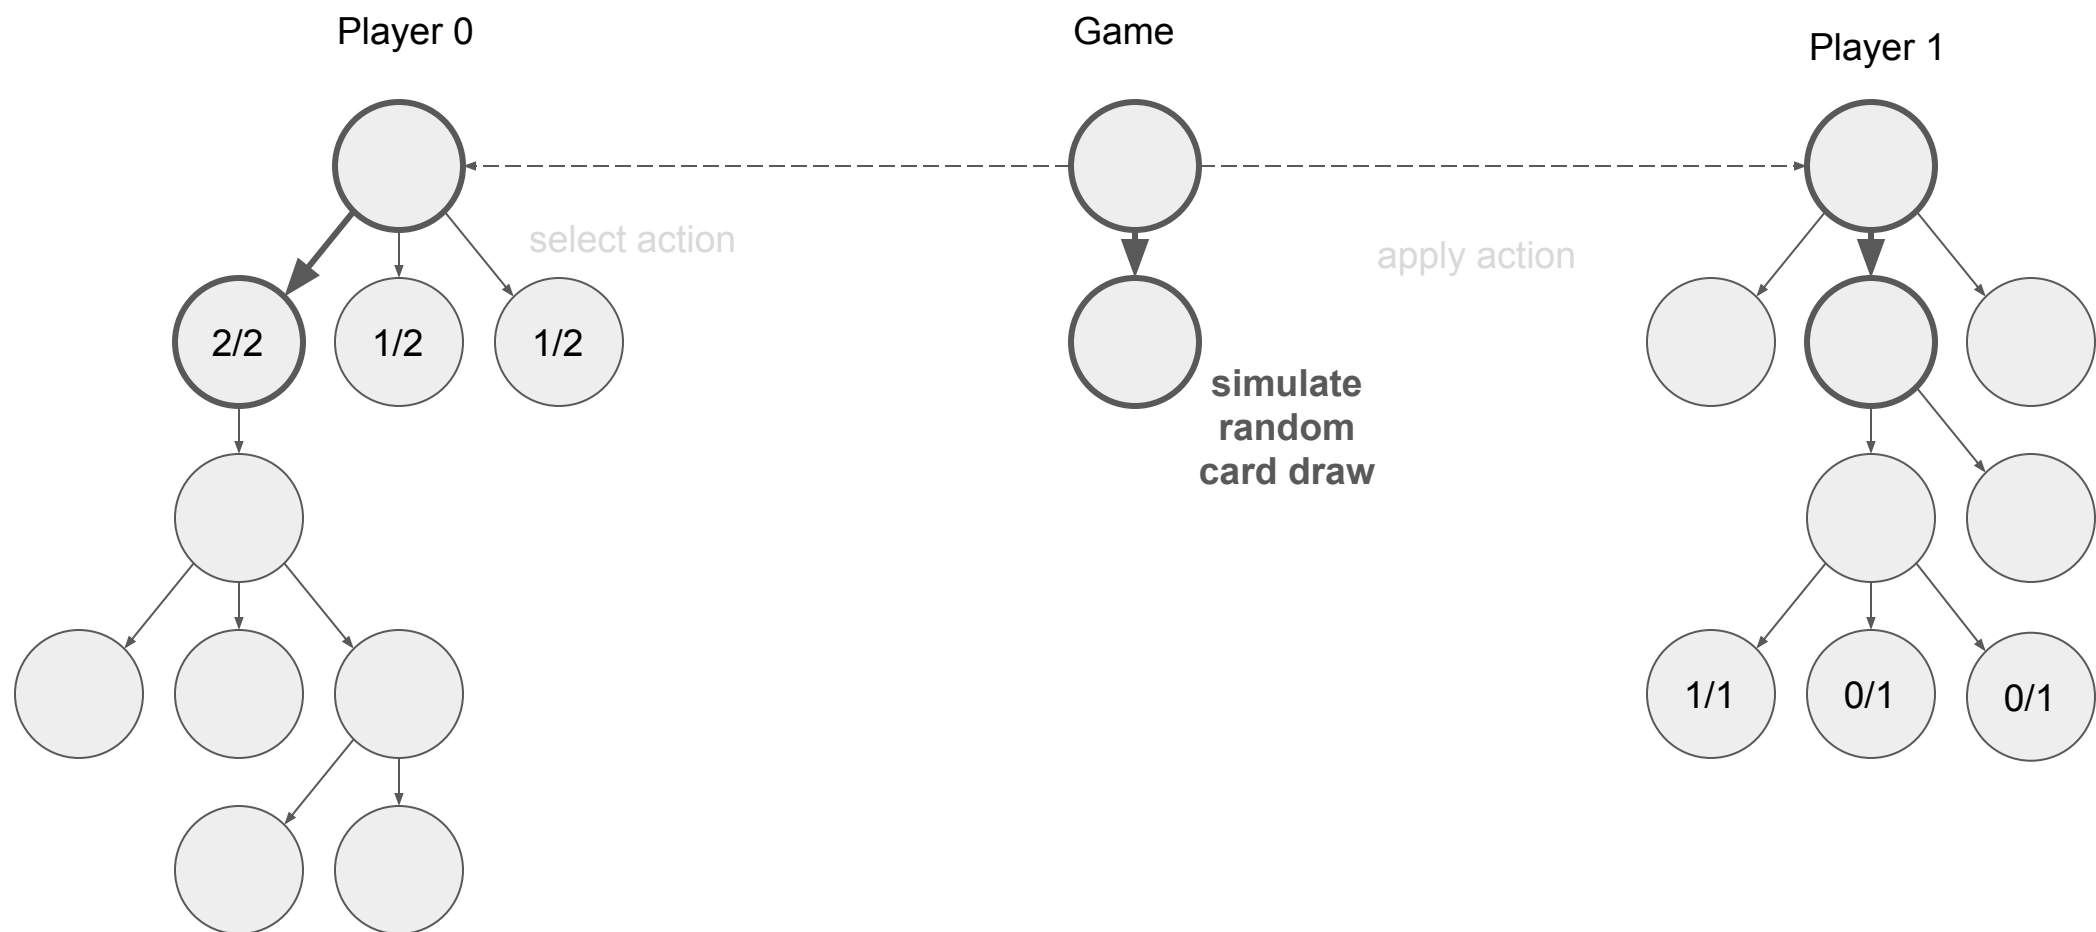

Player 0 selects the action with the highest UCB

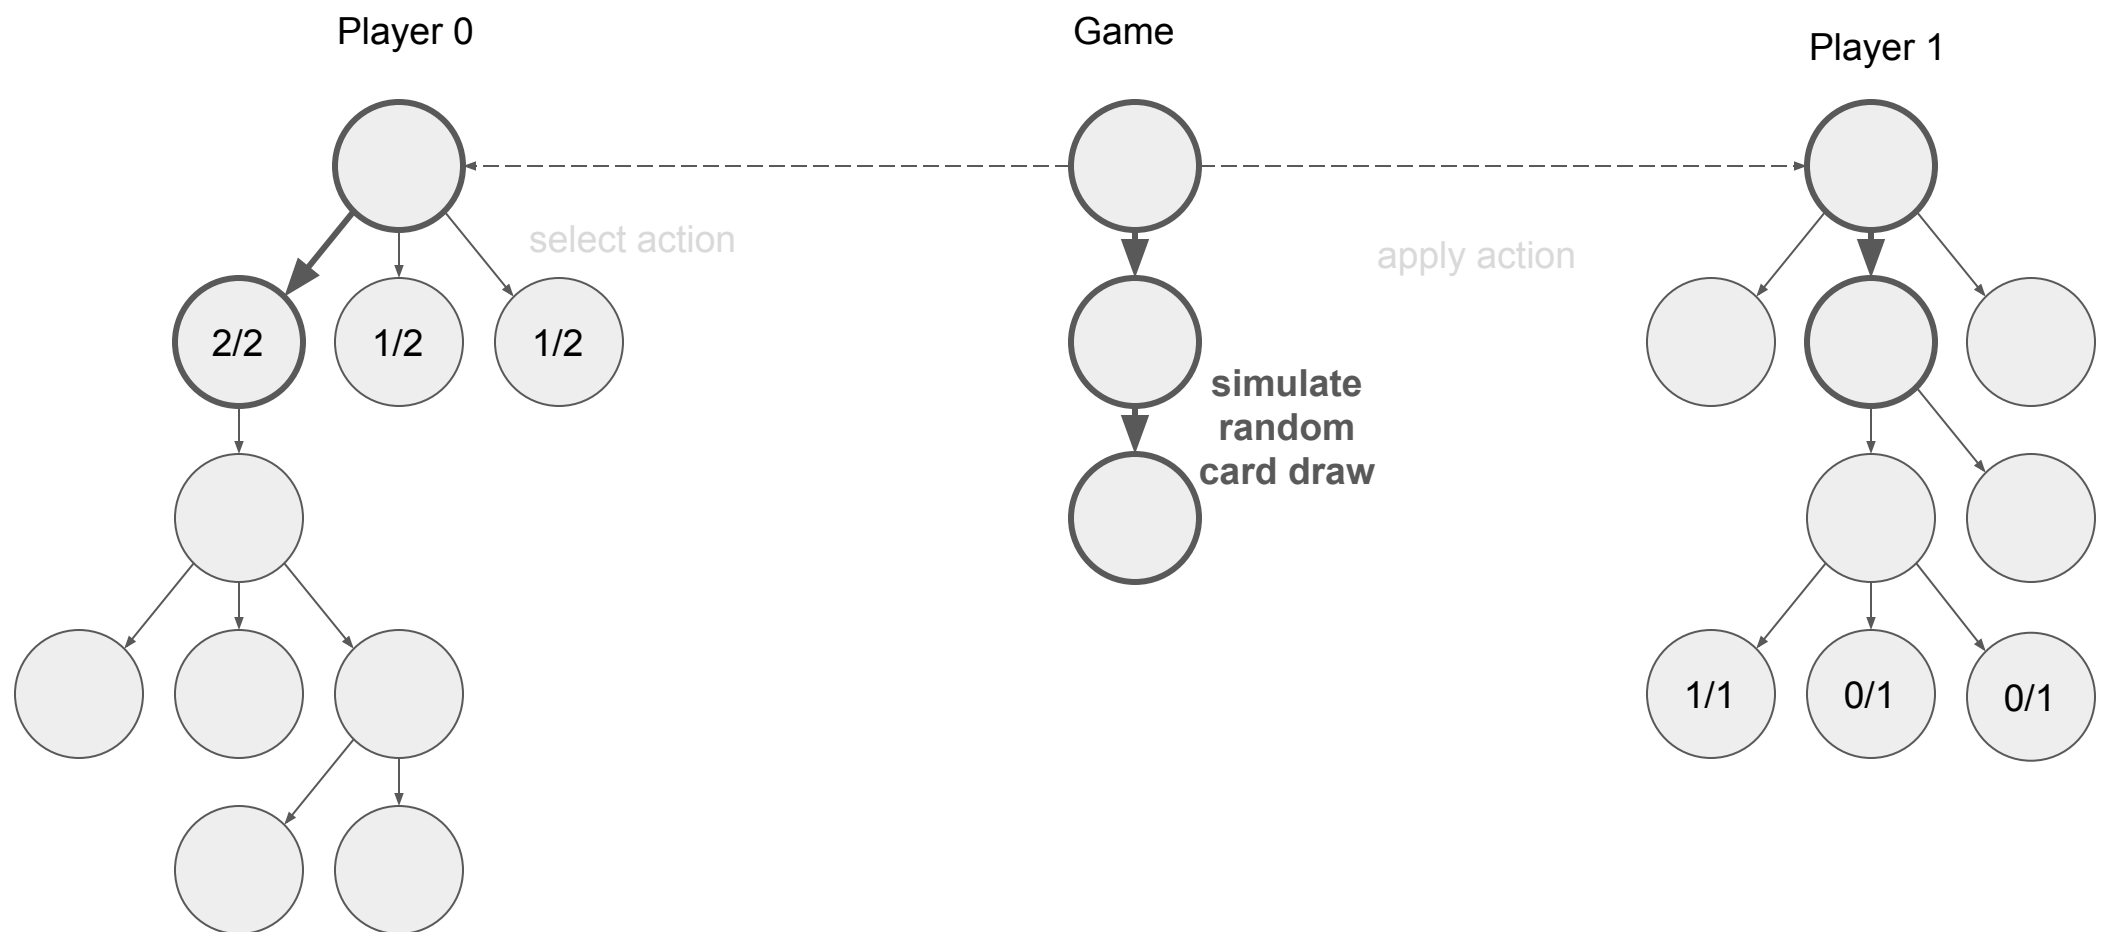

Apply Player 0's action to the simulation of the game and the tree of Player 1

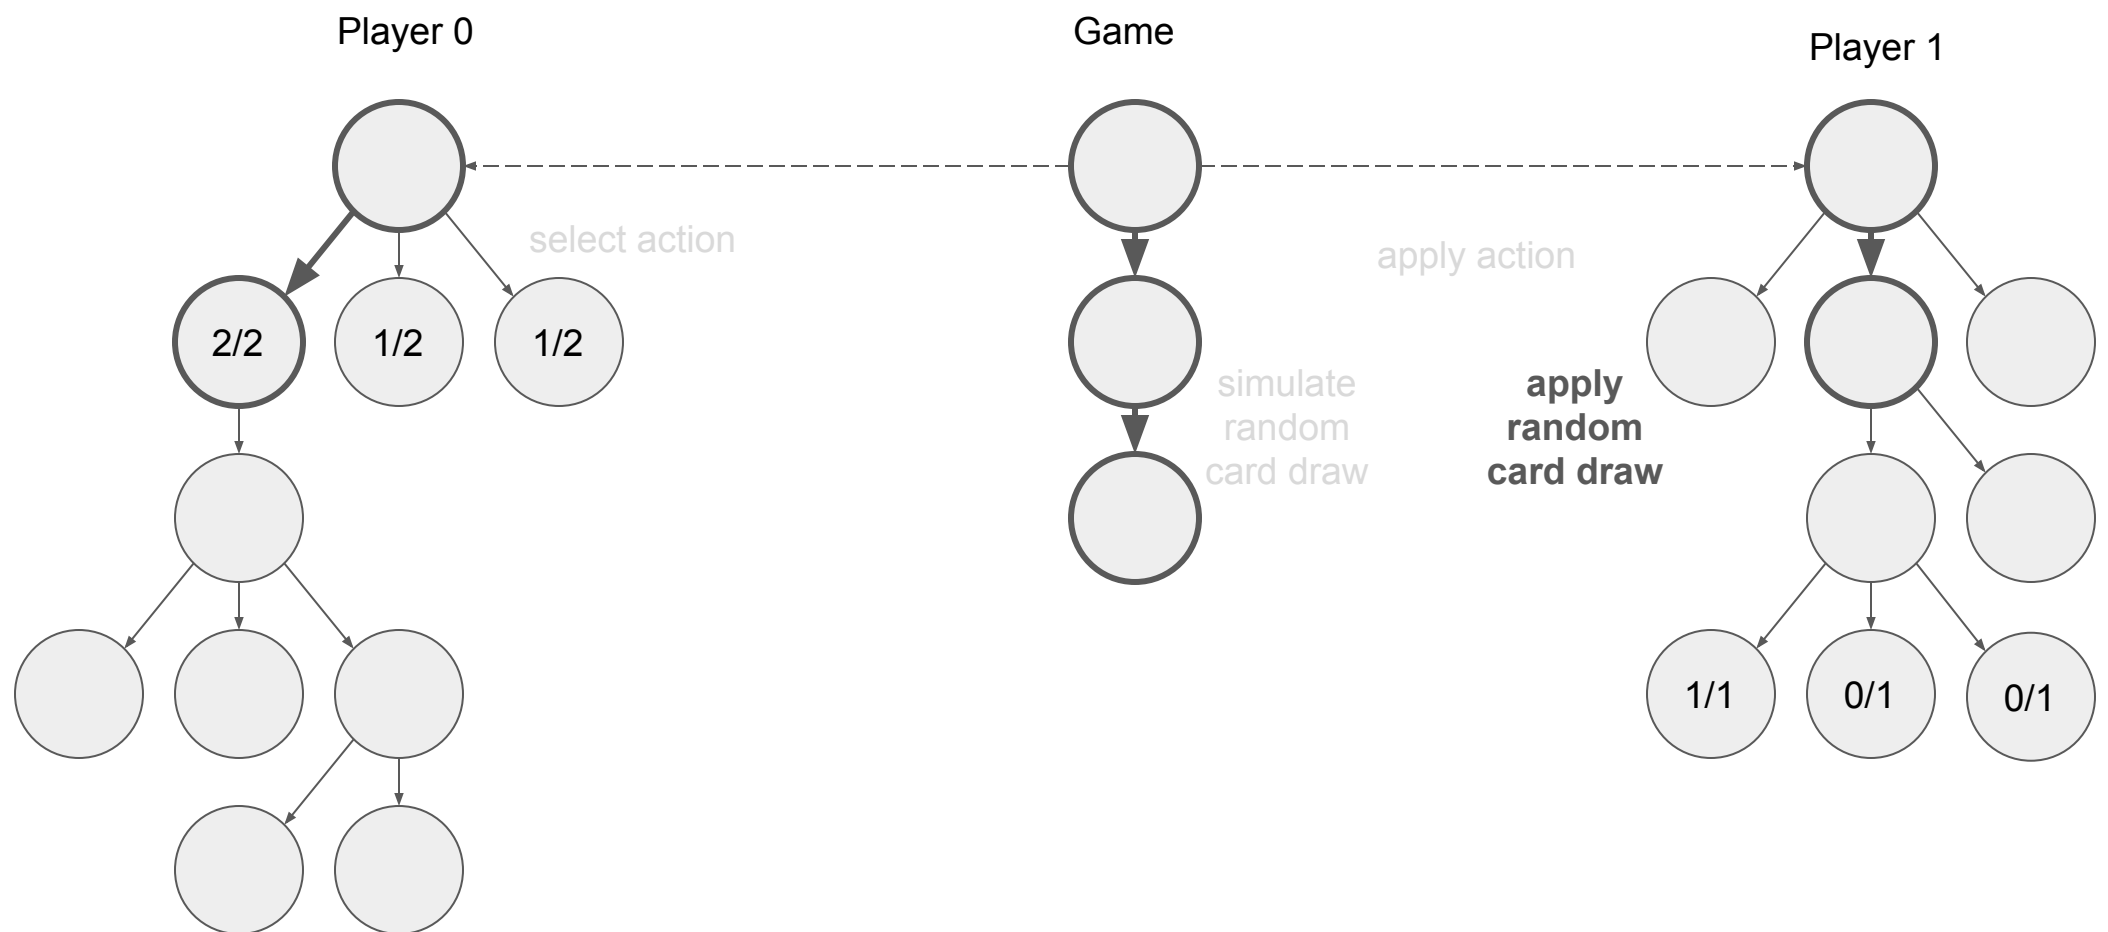

Apply Player 0's action to the simulation of the game and the tree of Player 1

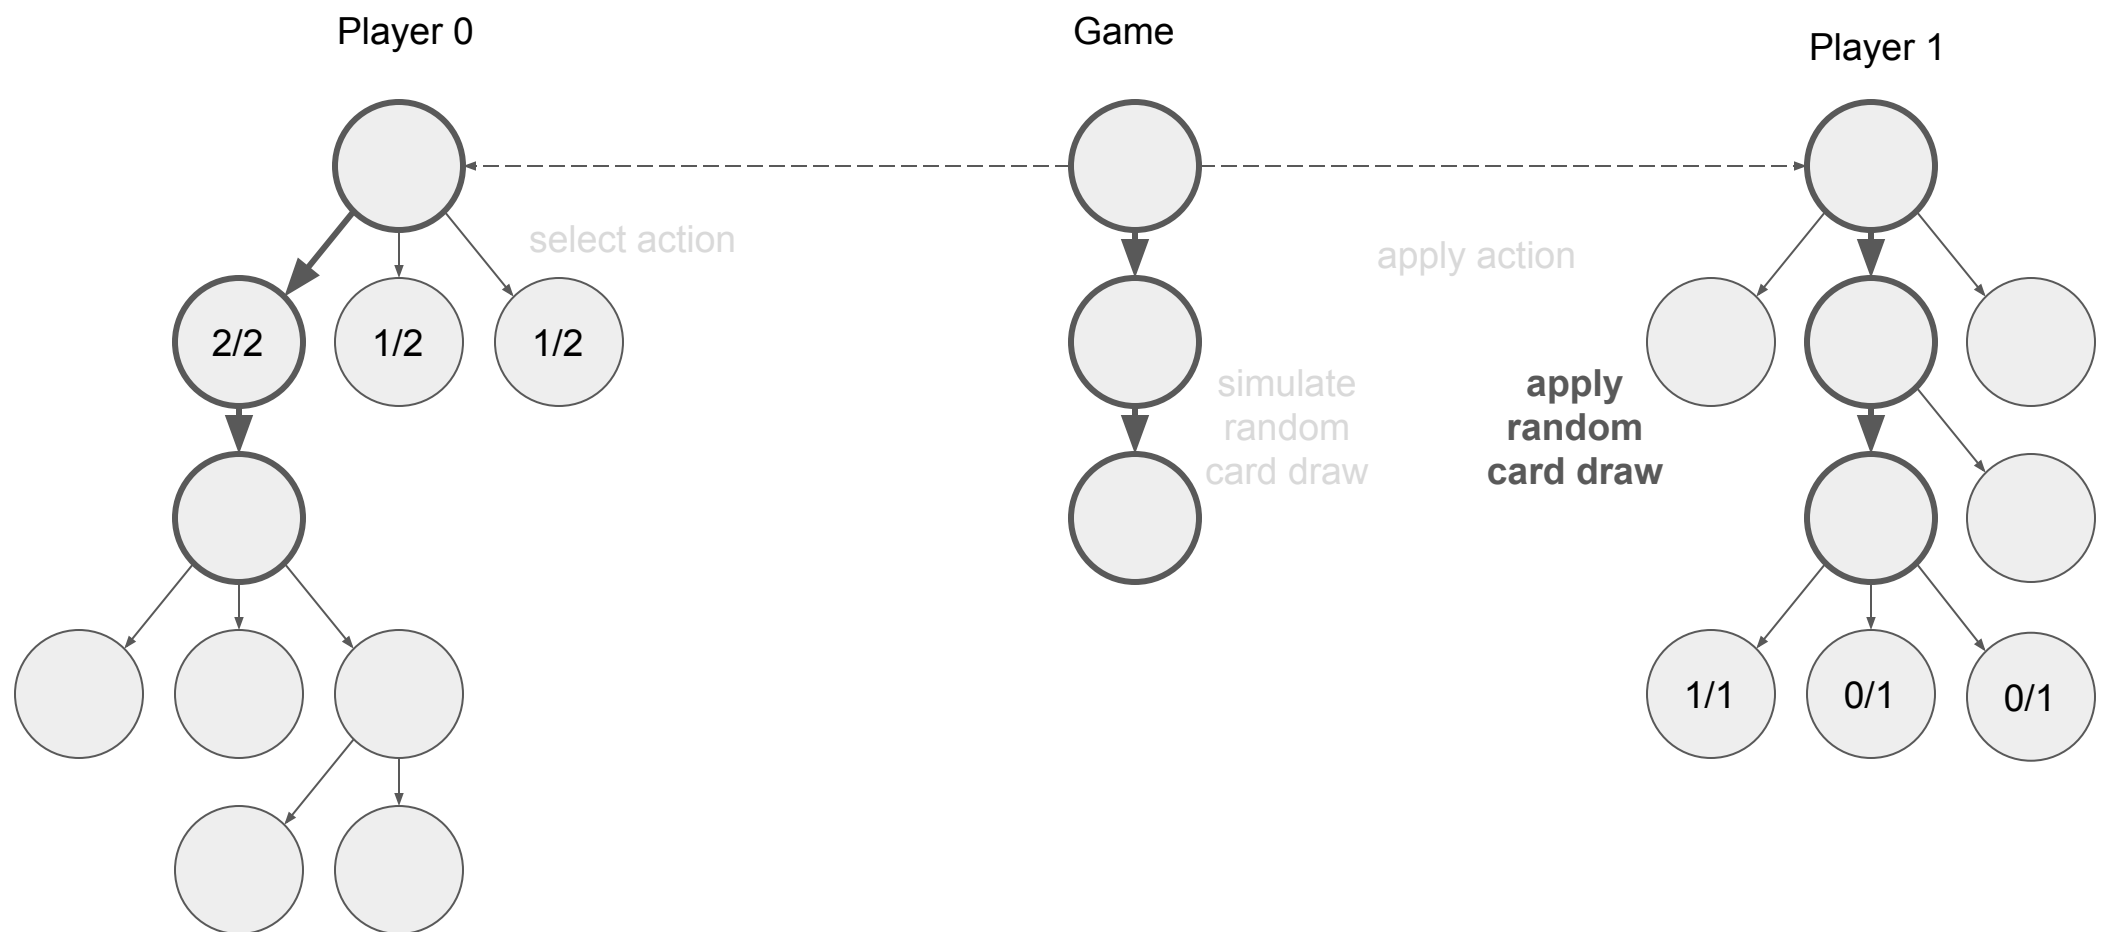

Randomly draw a card for player 1

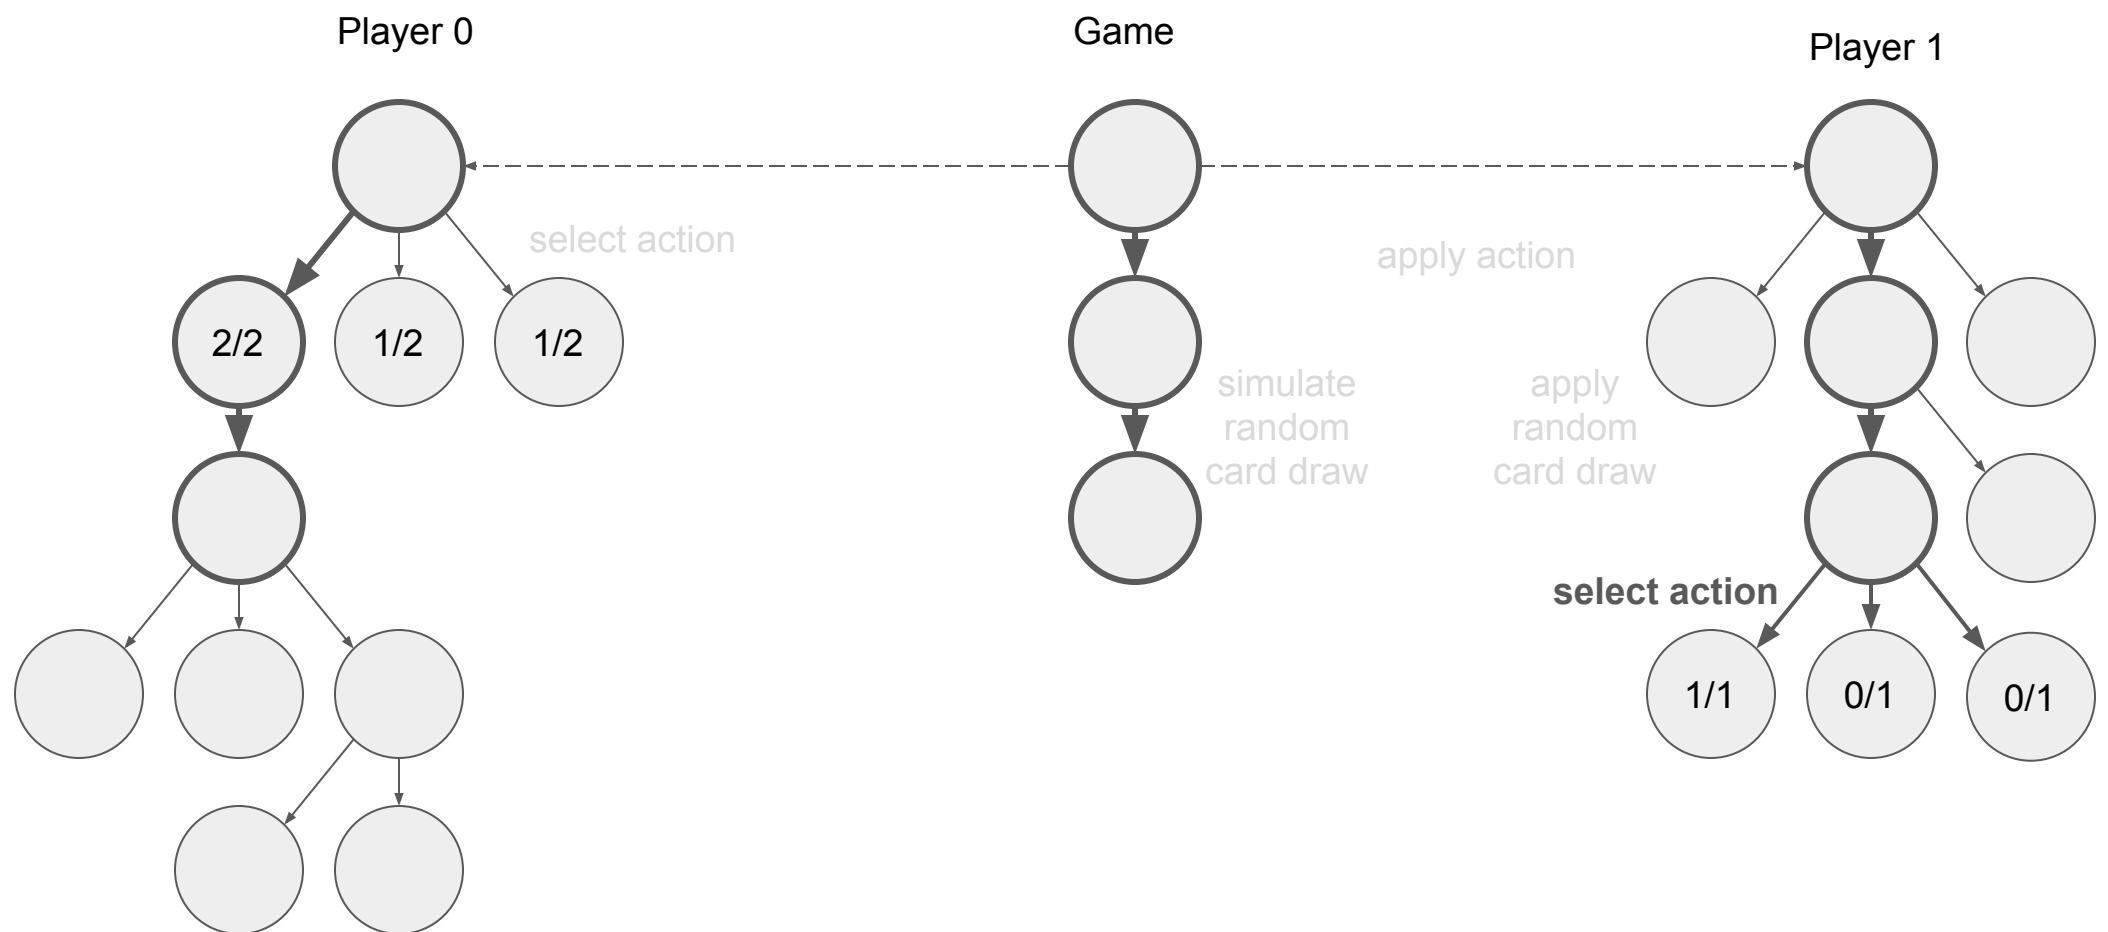

Randomly draw a card for player 1

Traverse to the next node based on the newly drawn card for Player 1

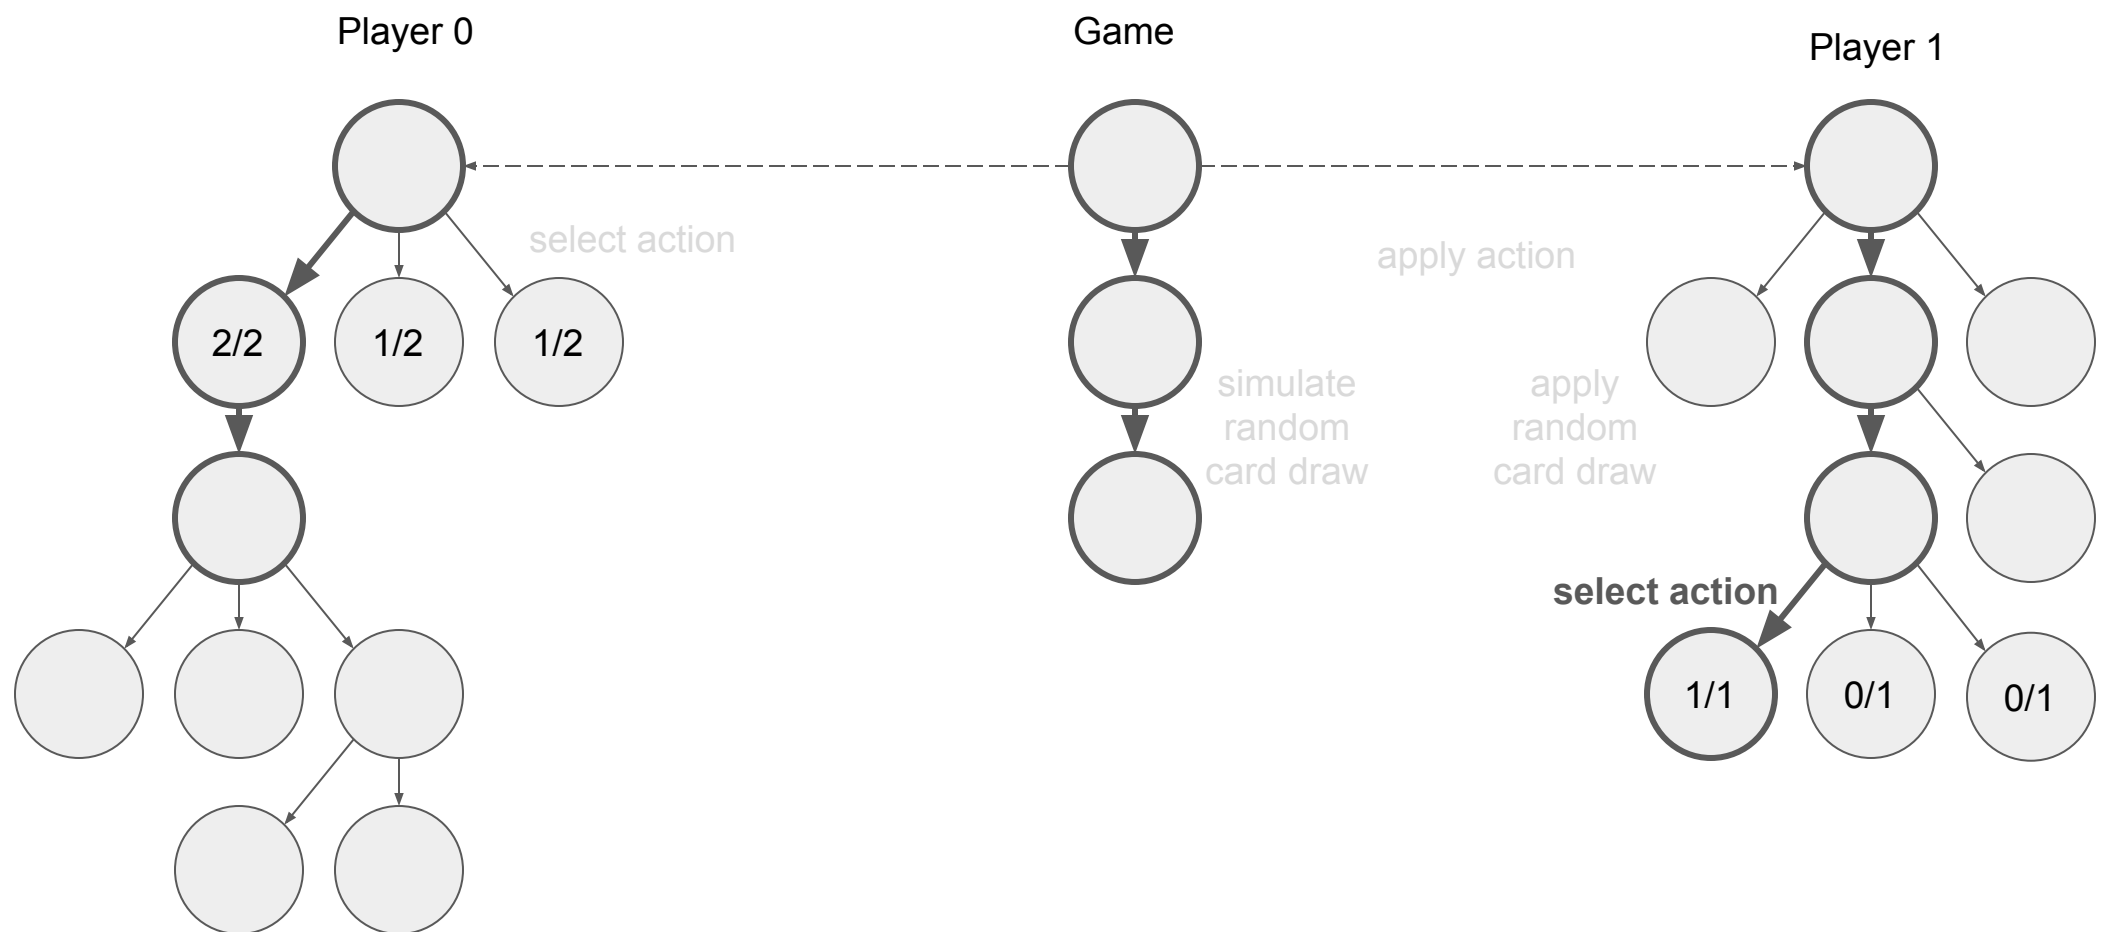

Traverse to the next node based on the newly drawn card for Player 1

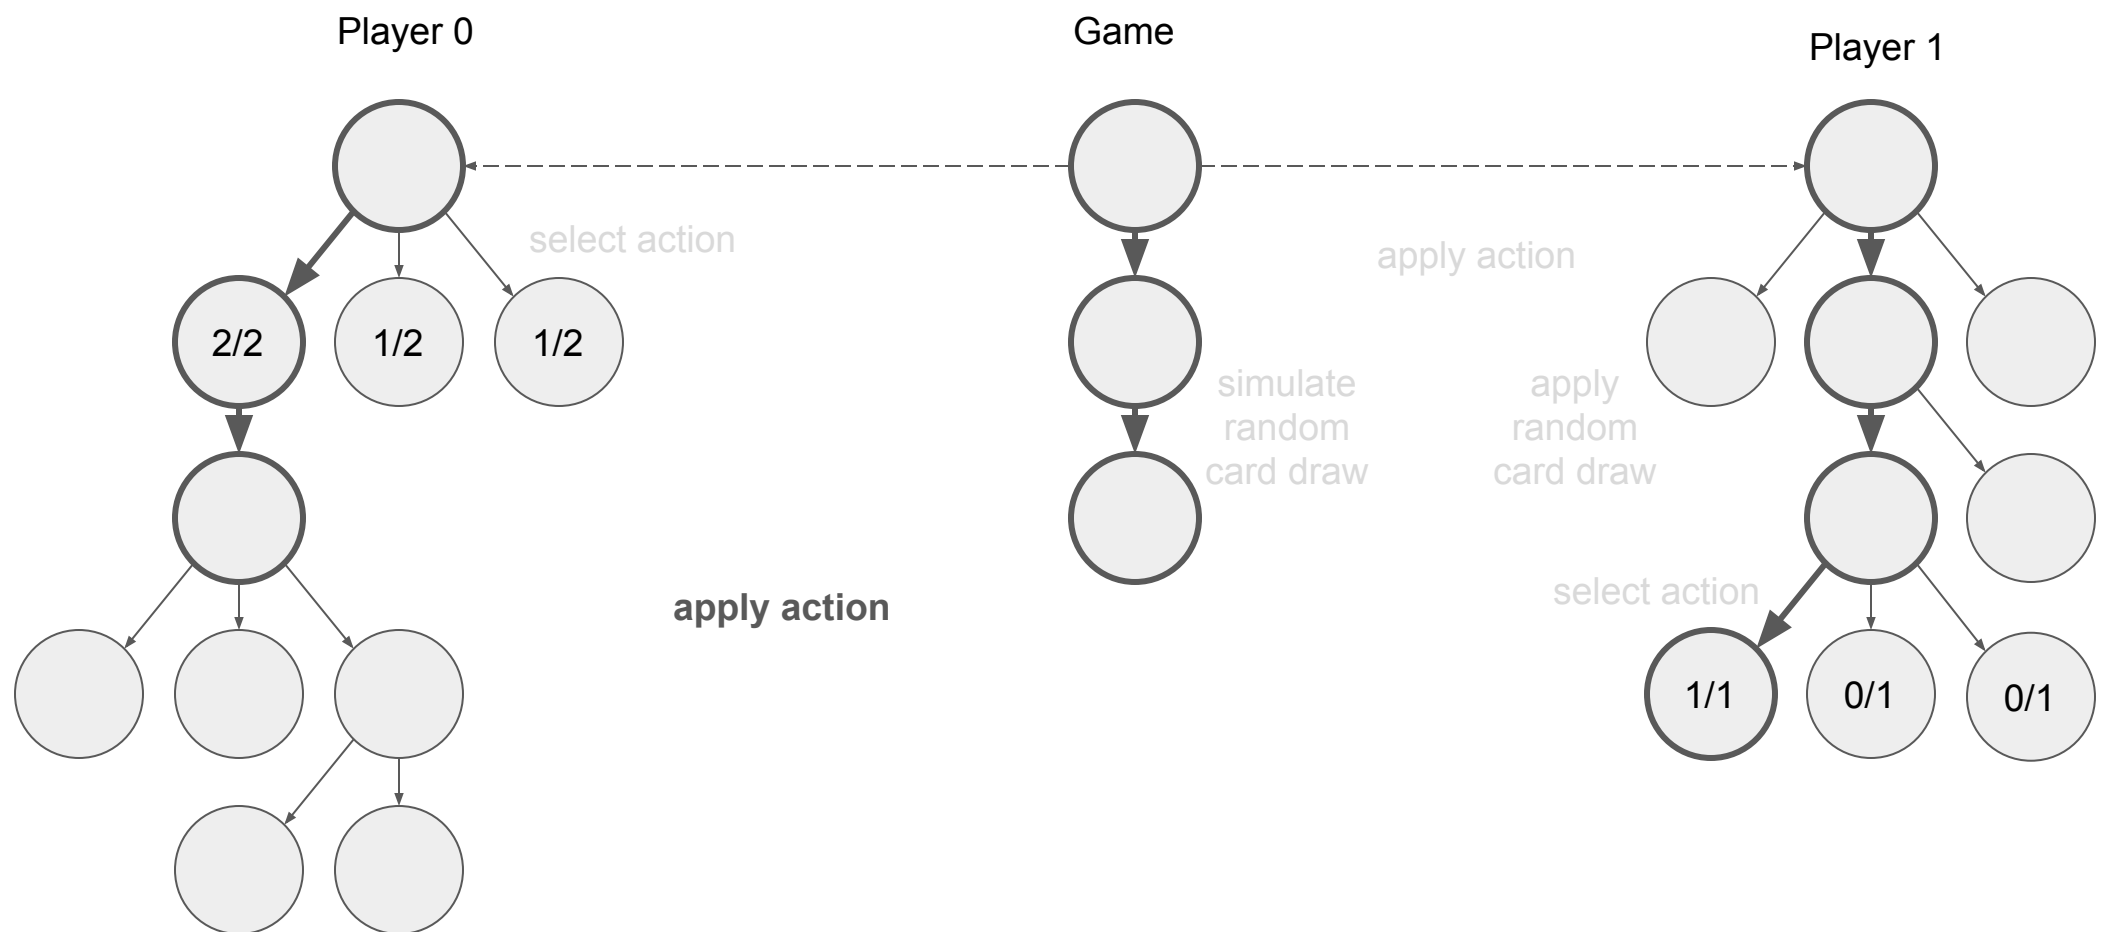

Player 1 selects the action with the highest UCB

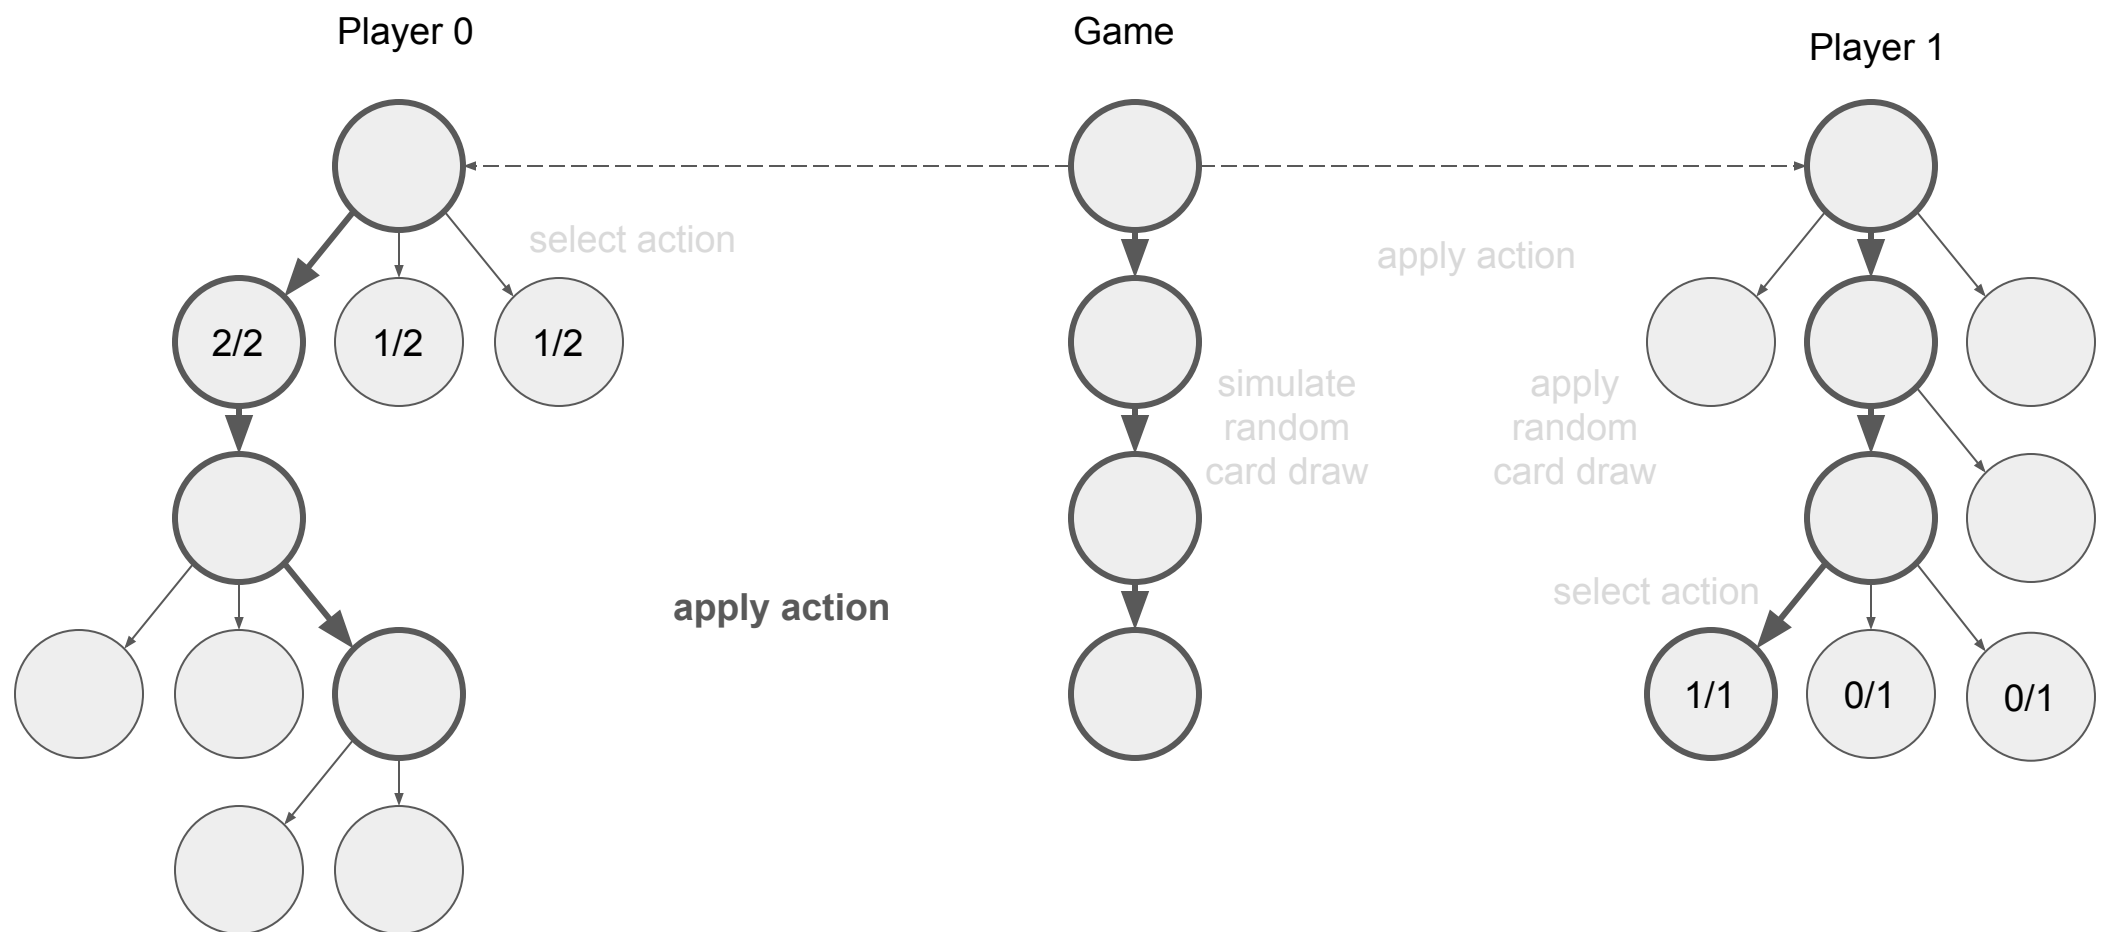

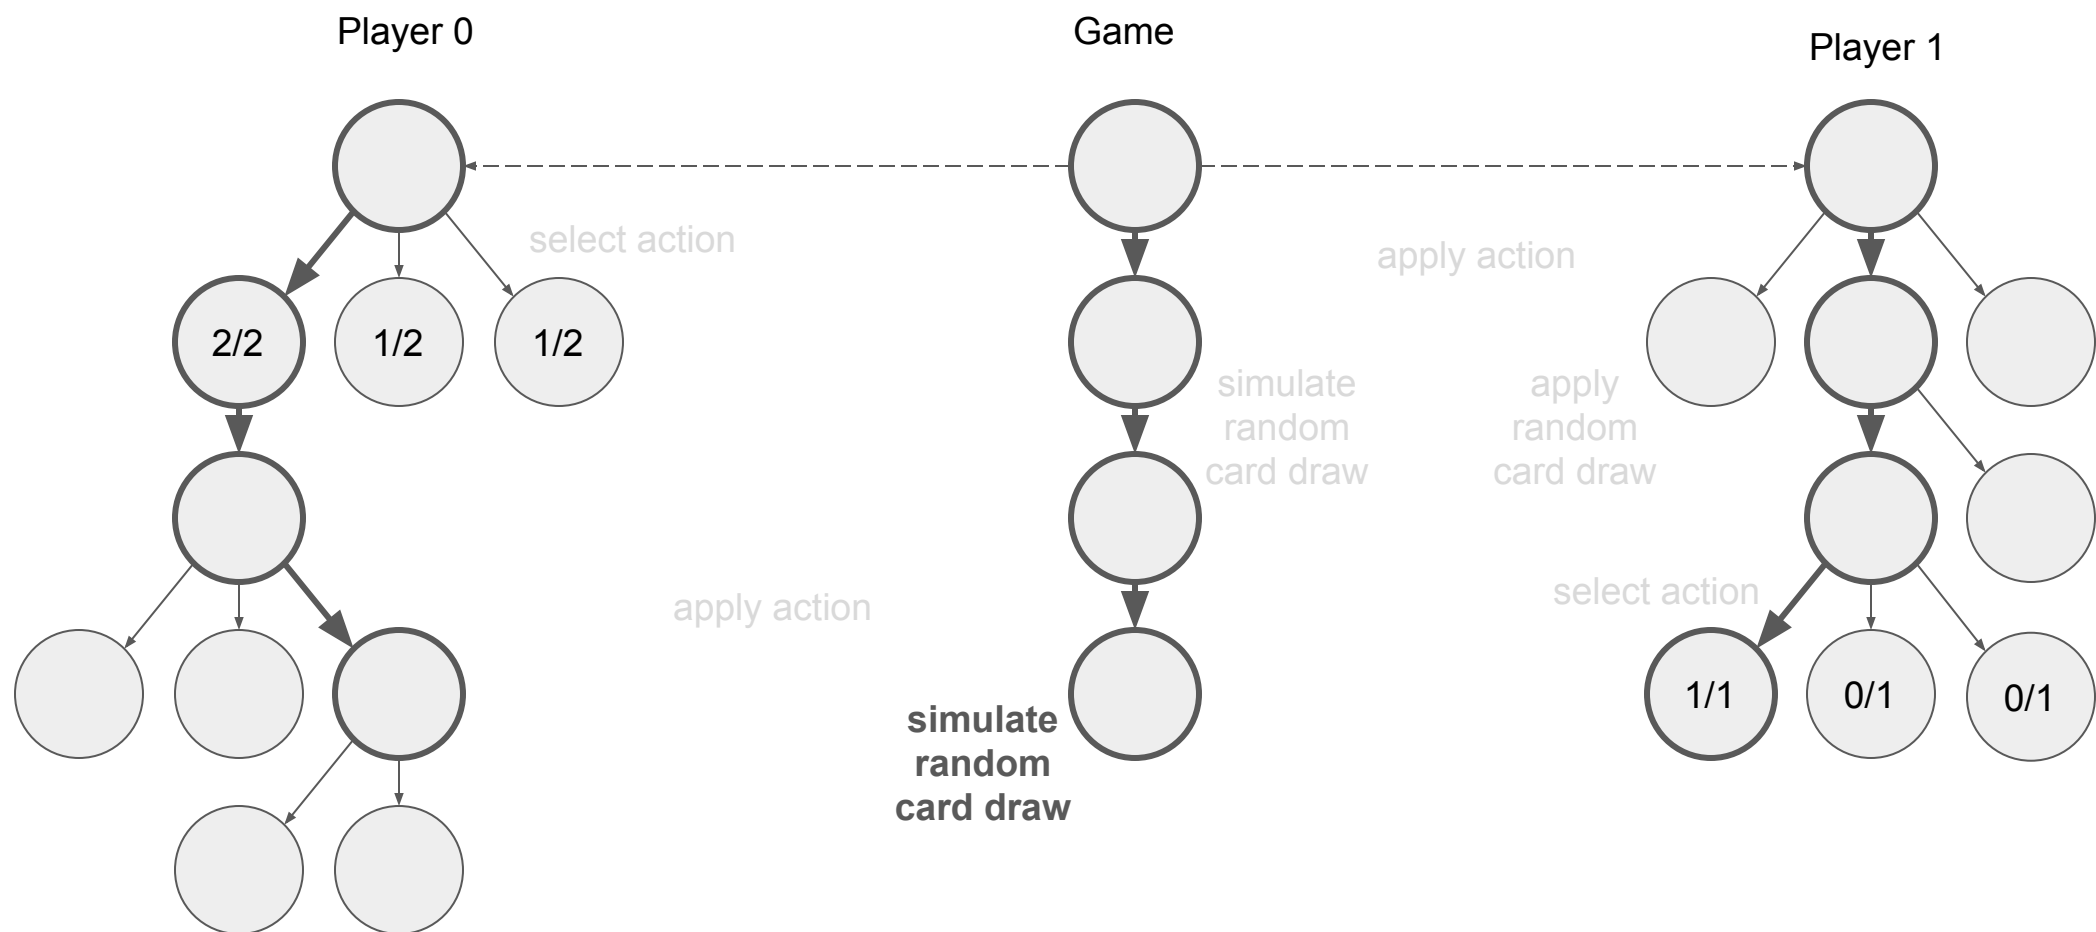

Player 1 selects the action with the highest UCB

Apply Player 1's action to the simulation of the game and the tree of Player 0

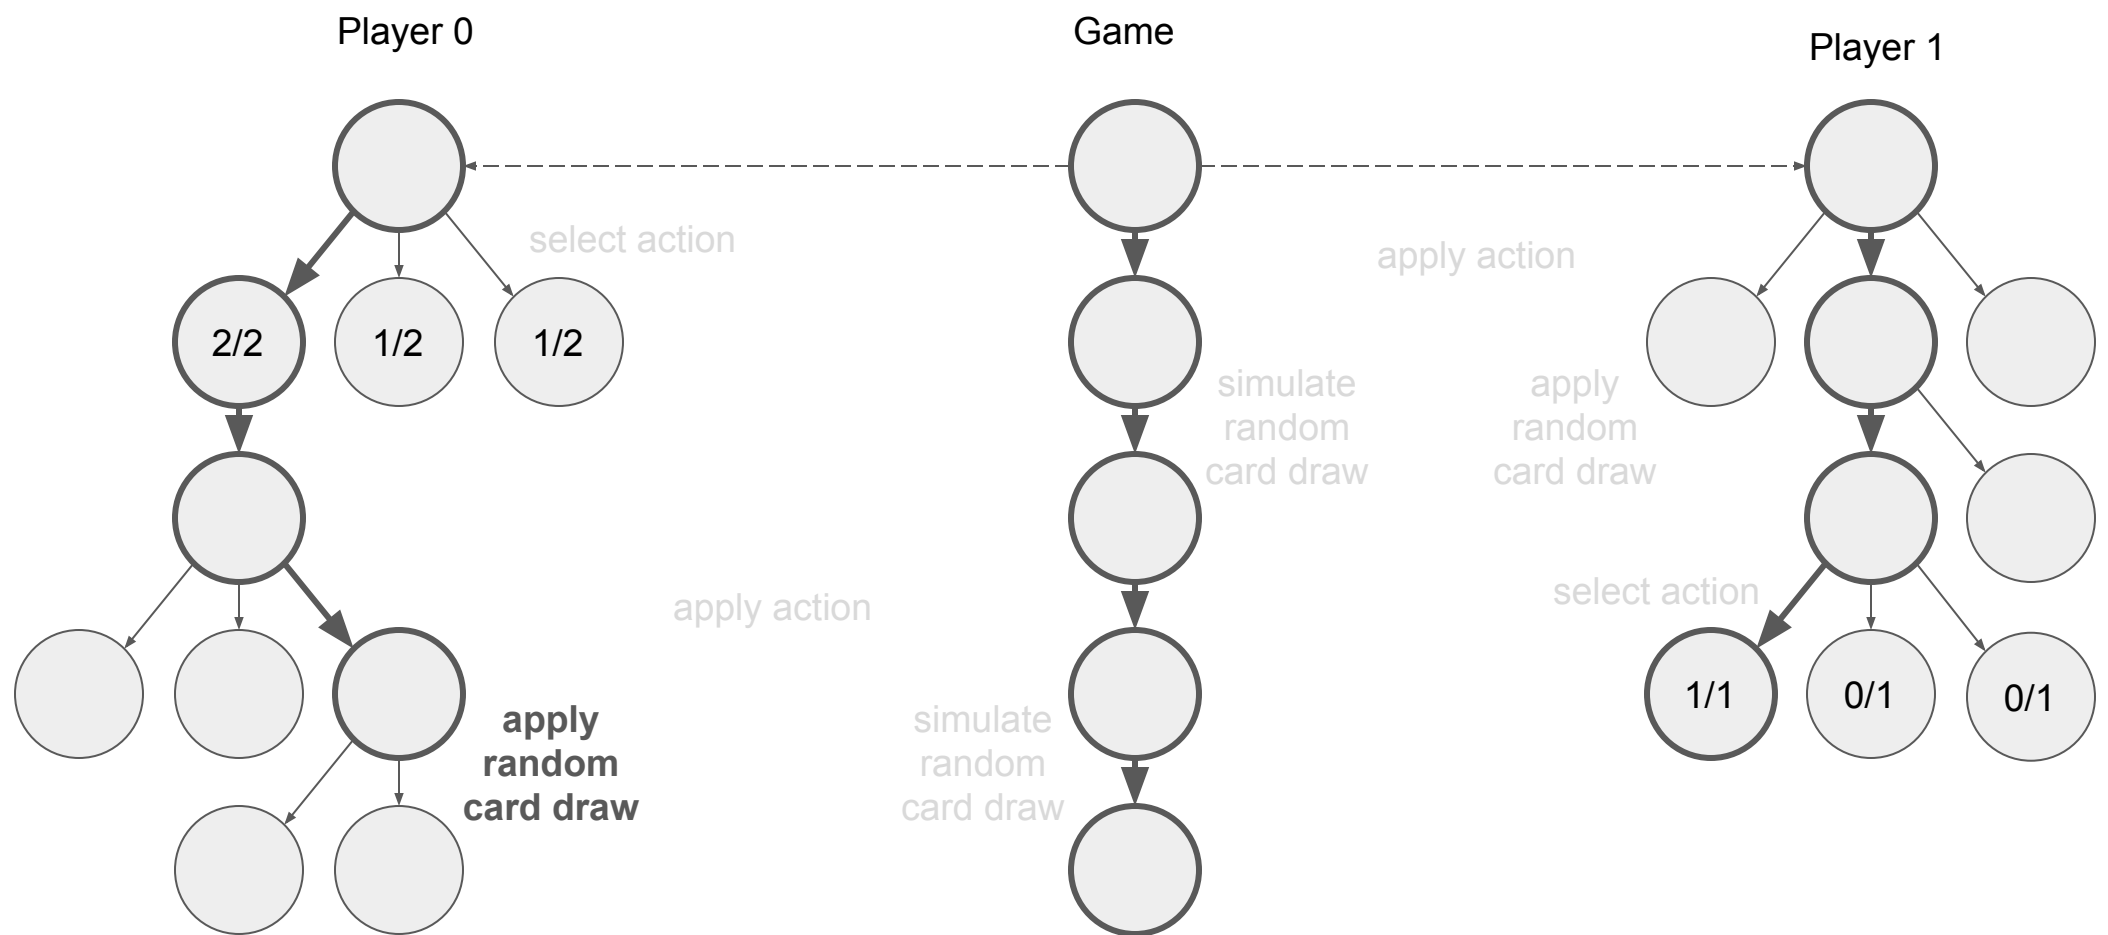

Apply Player 1's action to the simulation of the game and the tree of Player 0

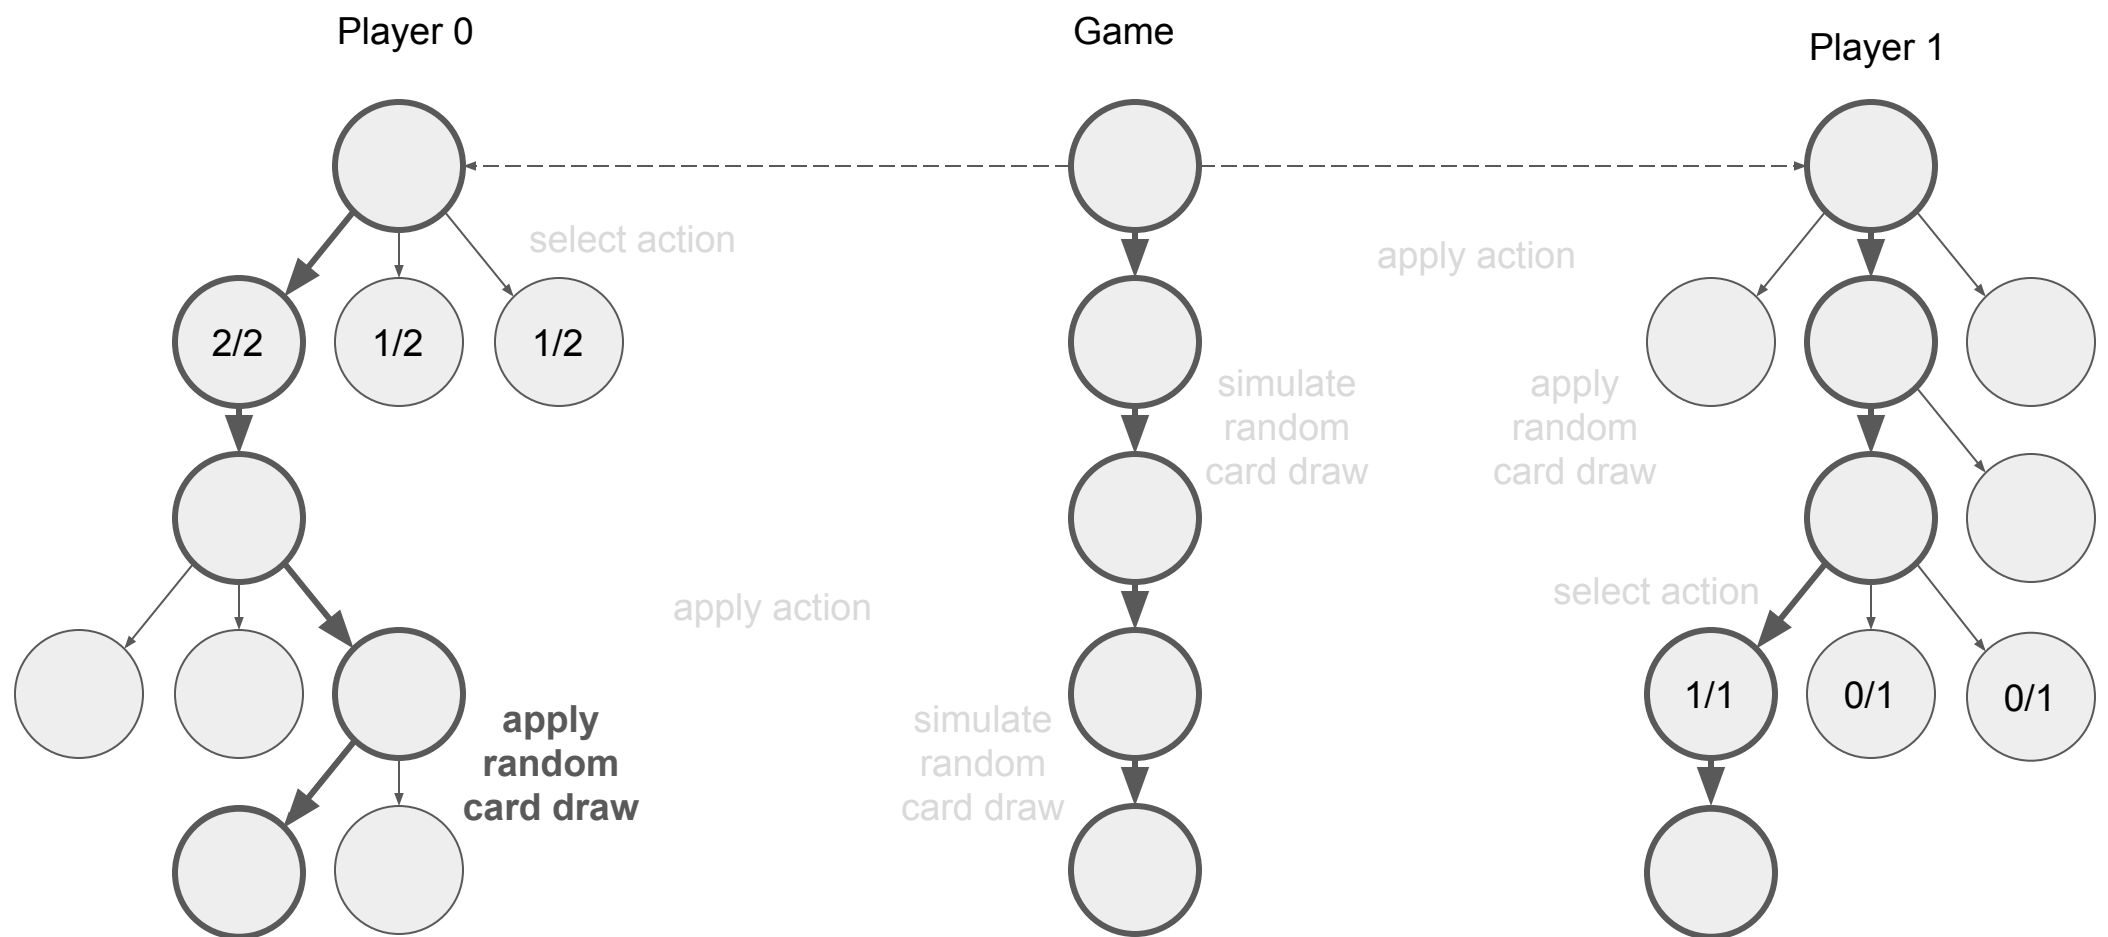

Randomly draw a card for player 0

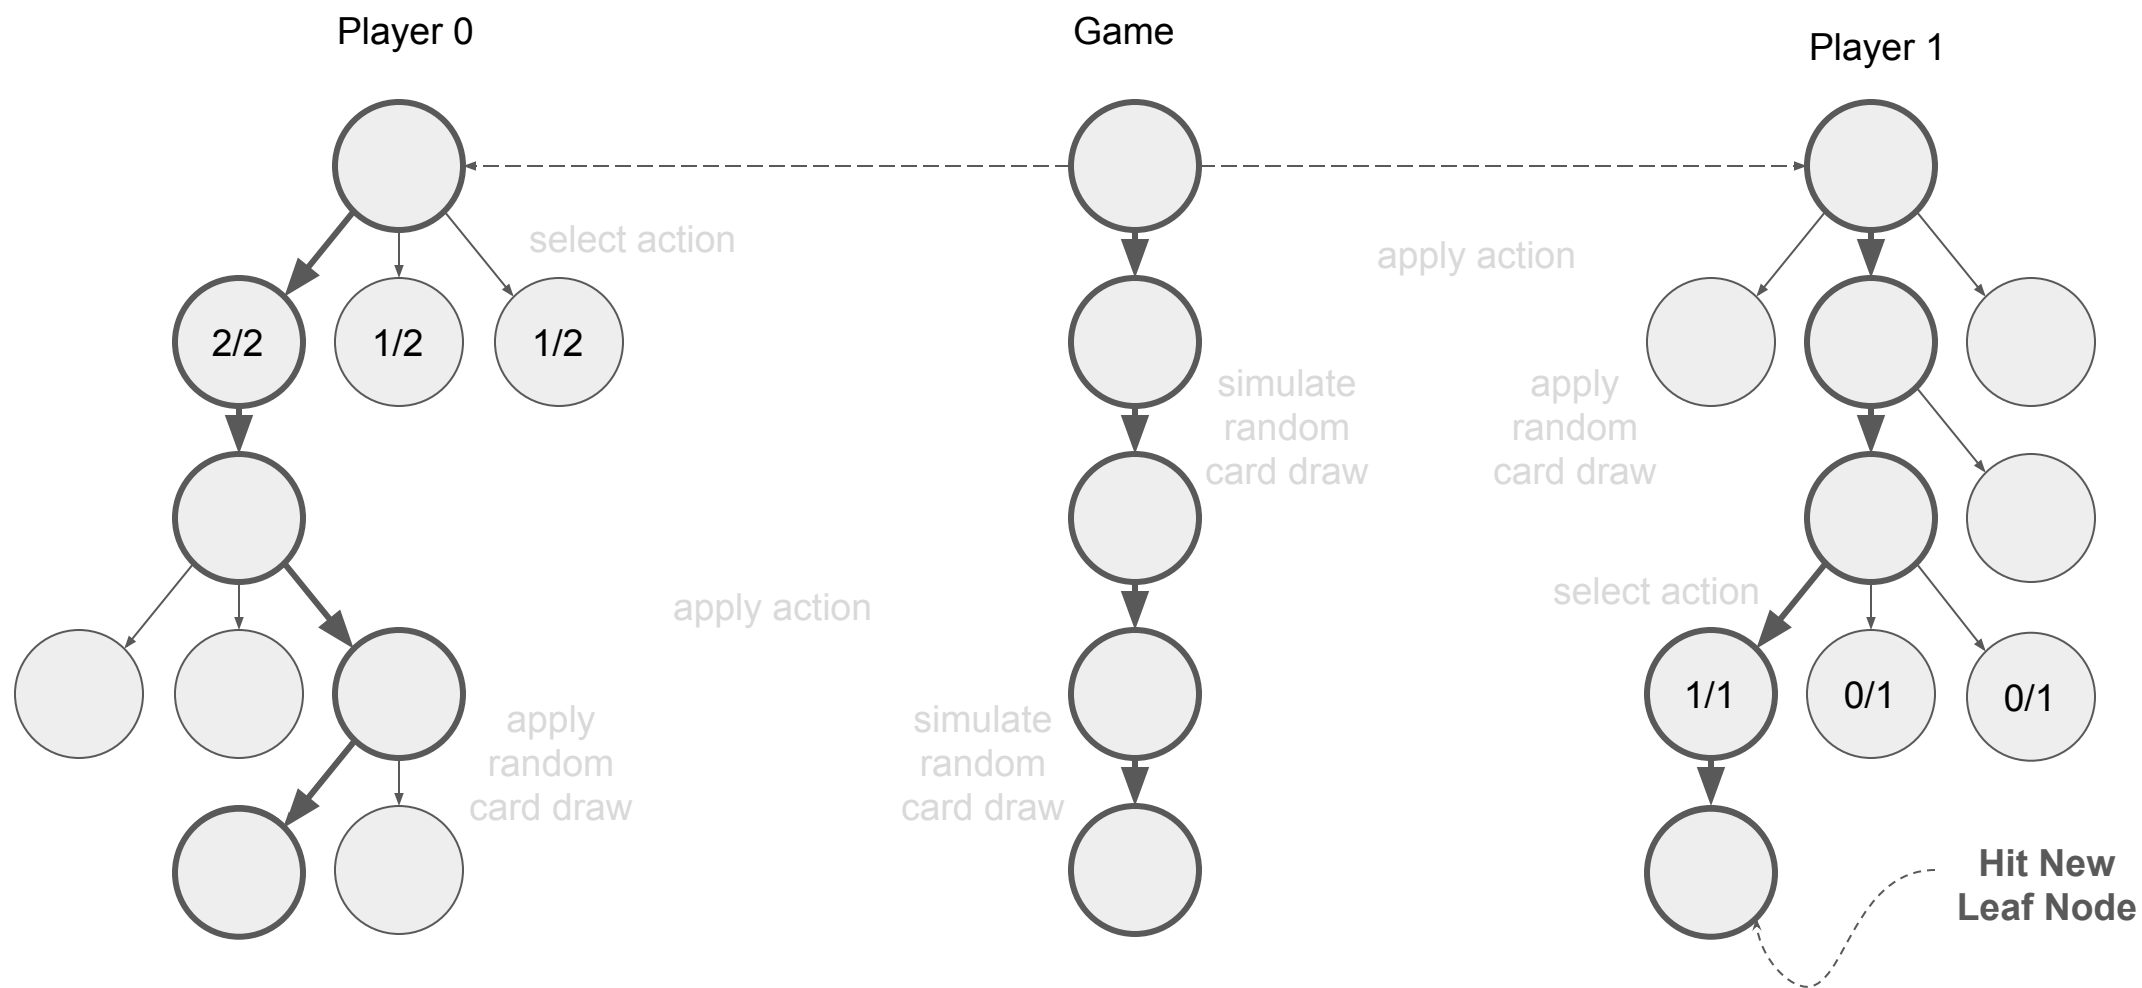

Traverse to the next node based on the newly drawn card for Player 0

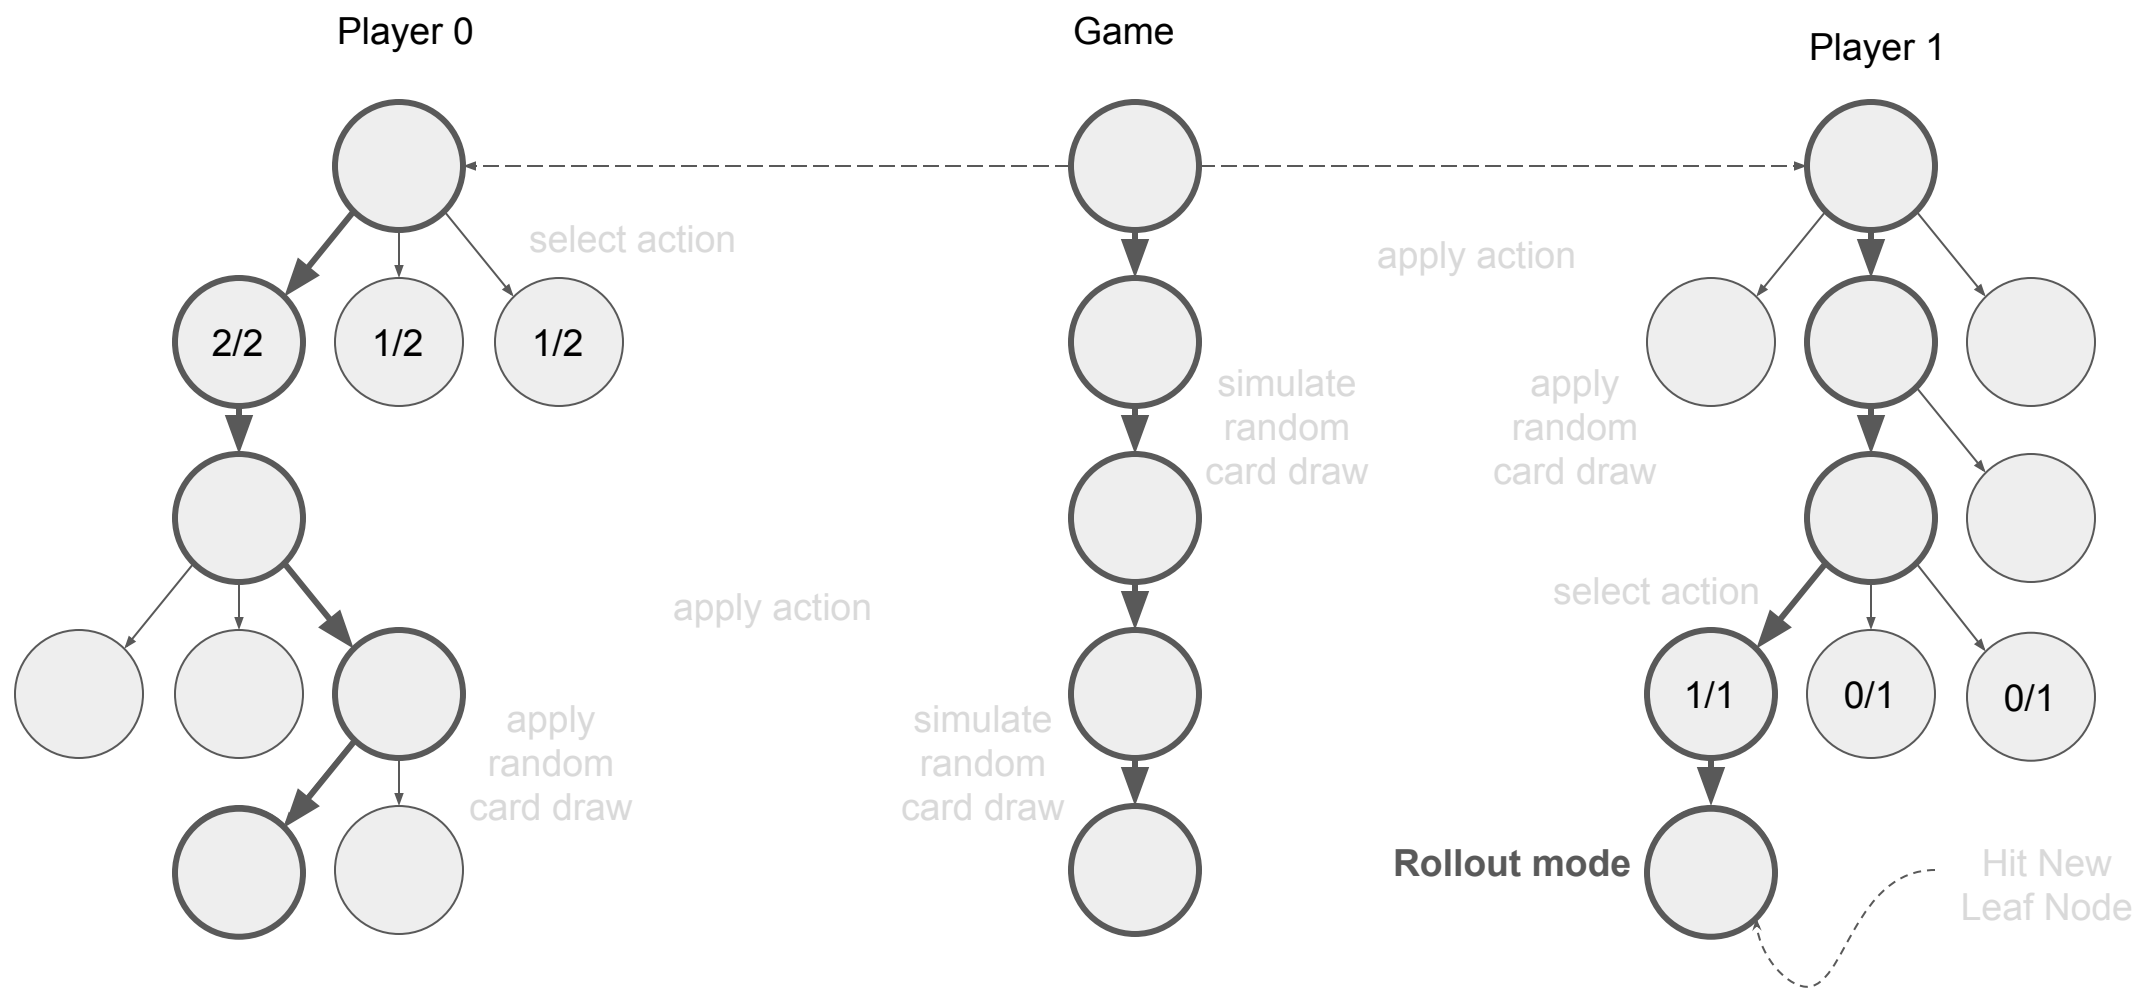

Traverse to the next node based on the newly drawn card for Player 0

When a new leaf node is sprouted (a neutral node), the tree is set to 'rollout mode'.

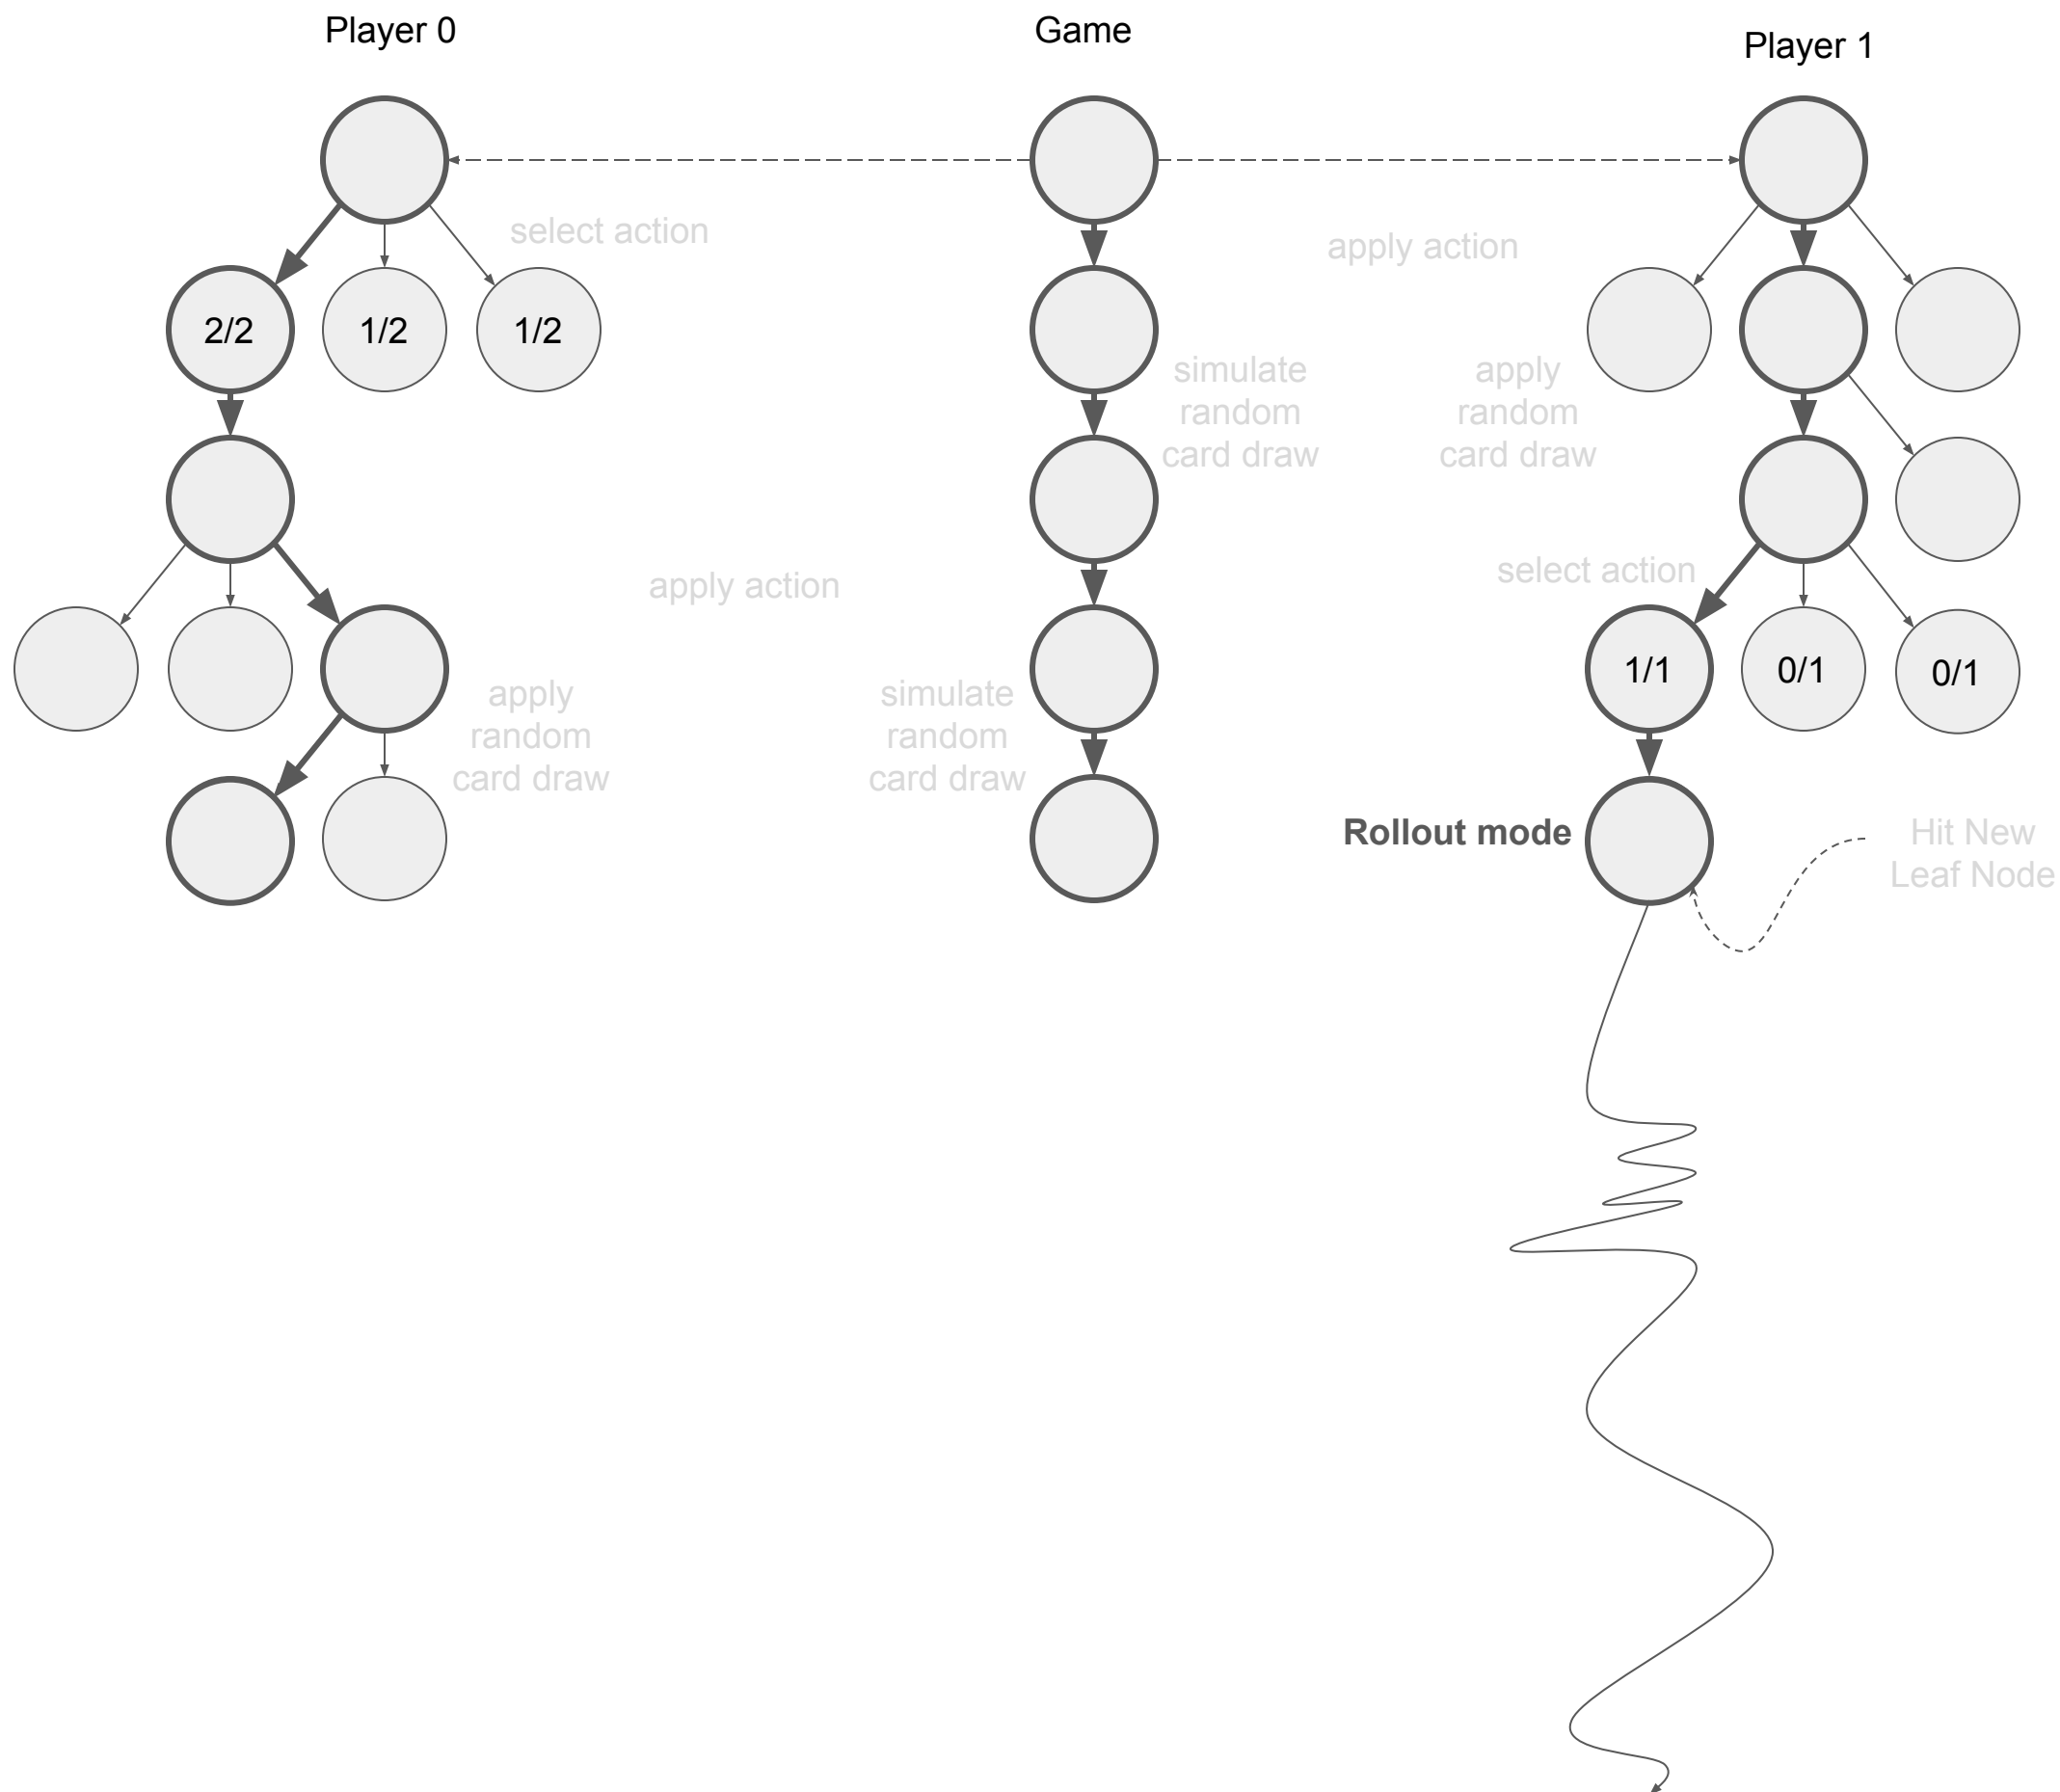

Pick random actions  
Don't sprout new nodes

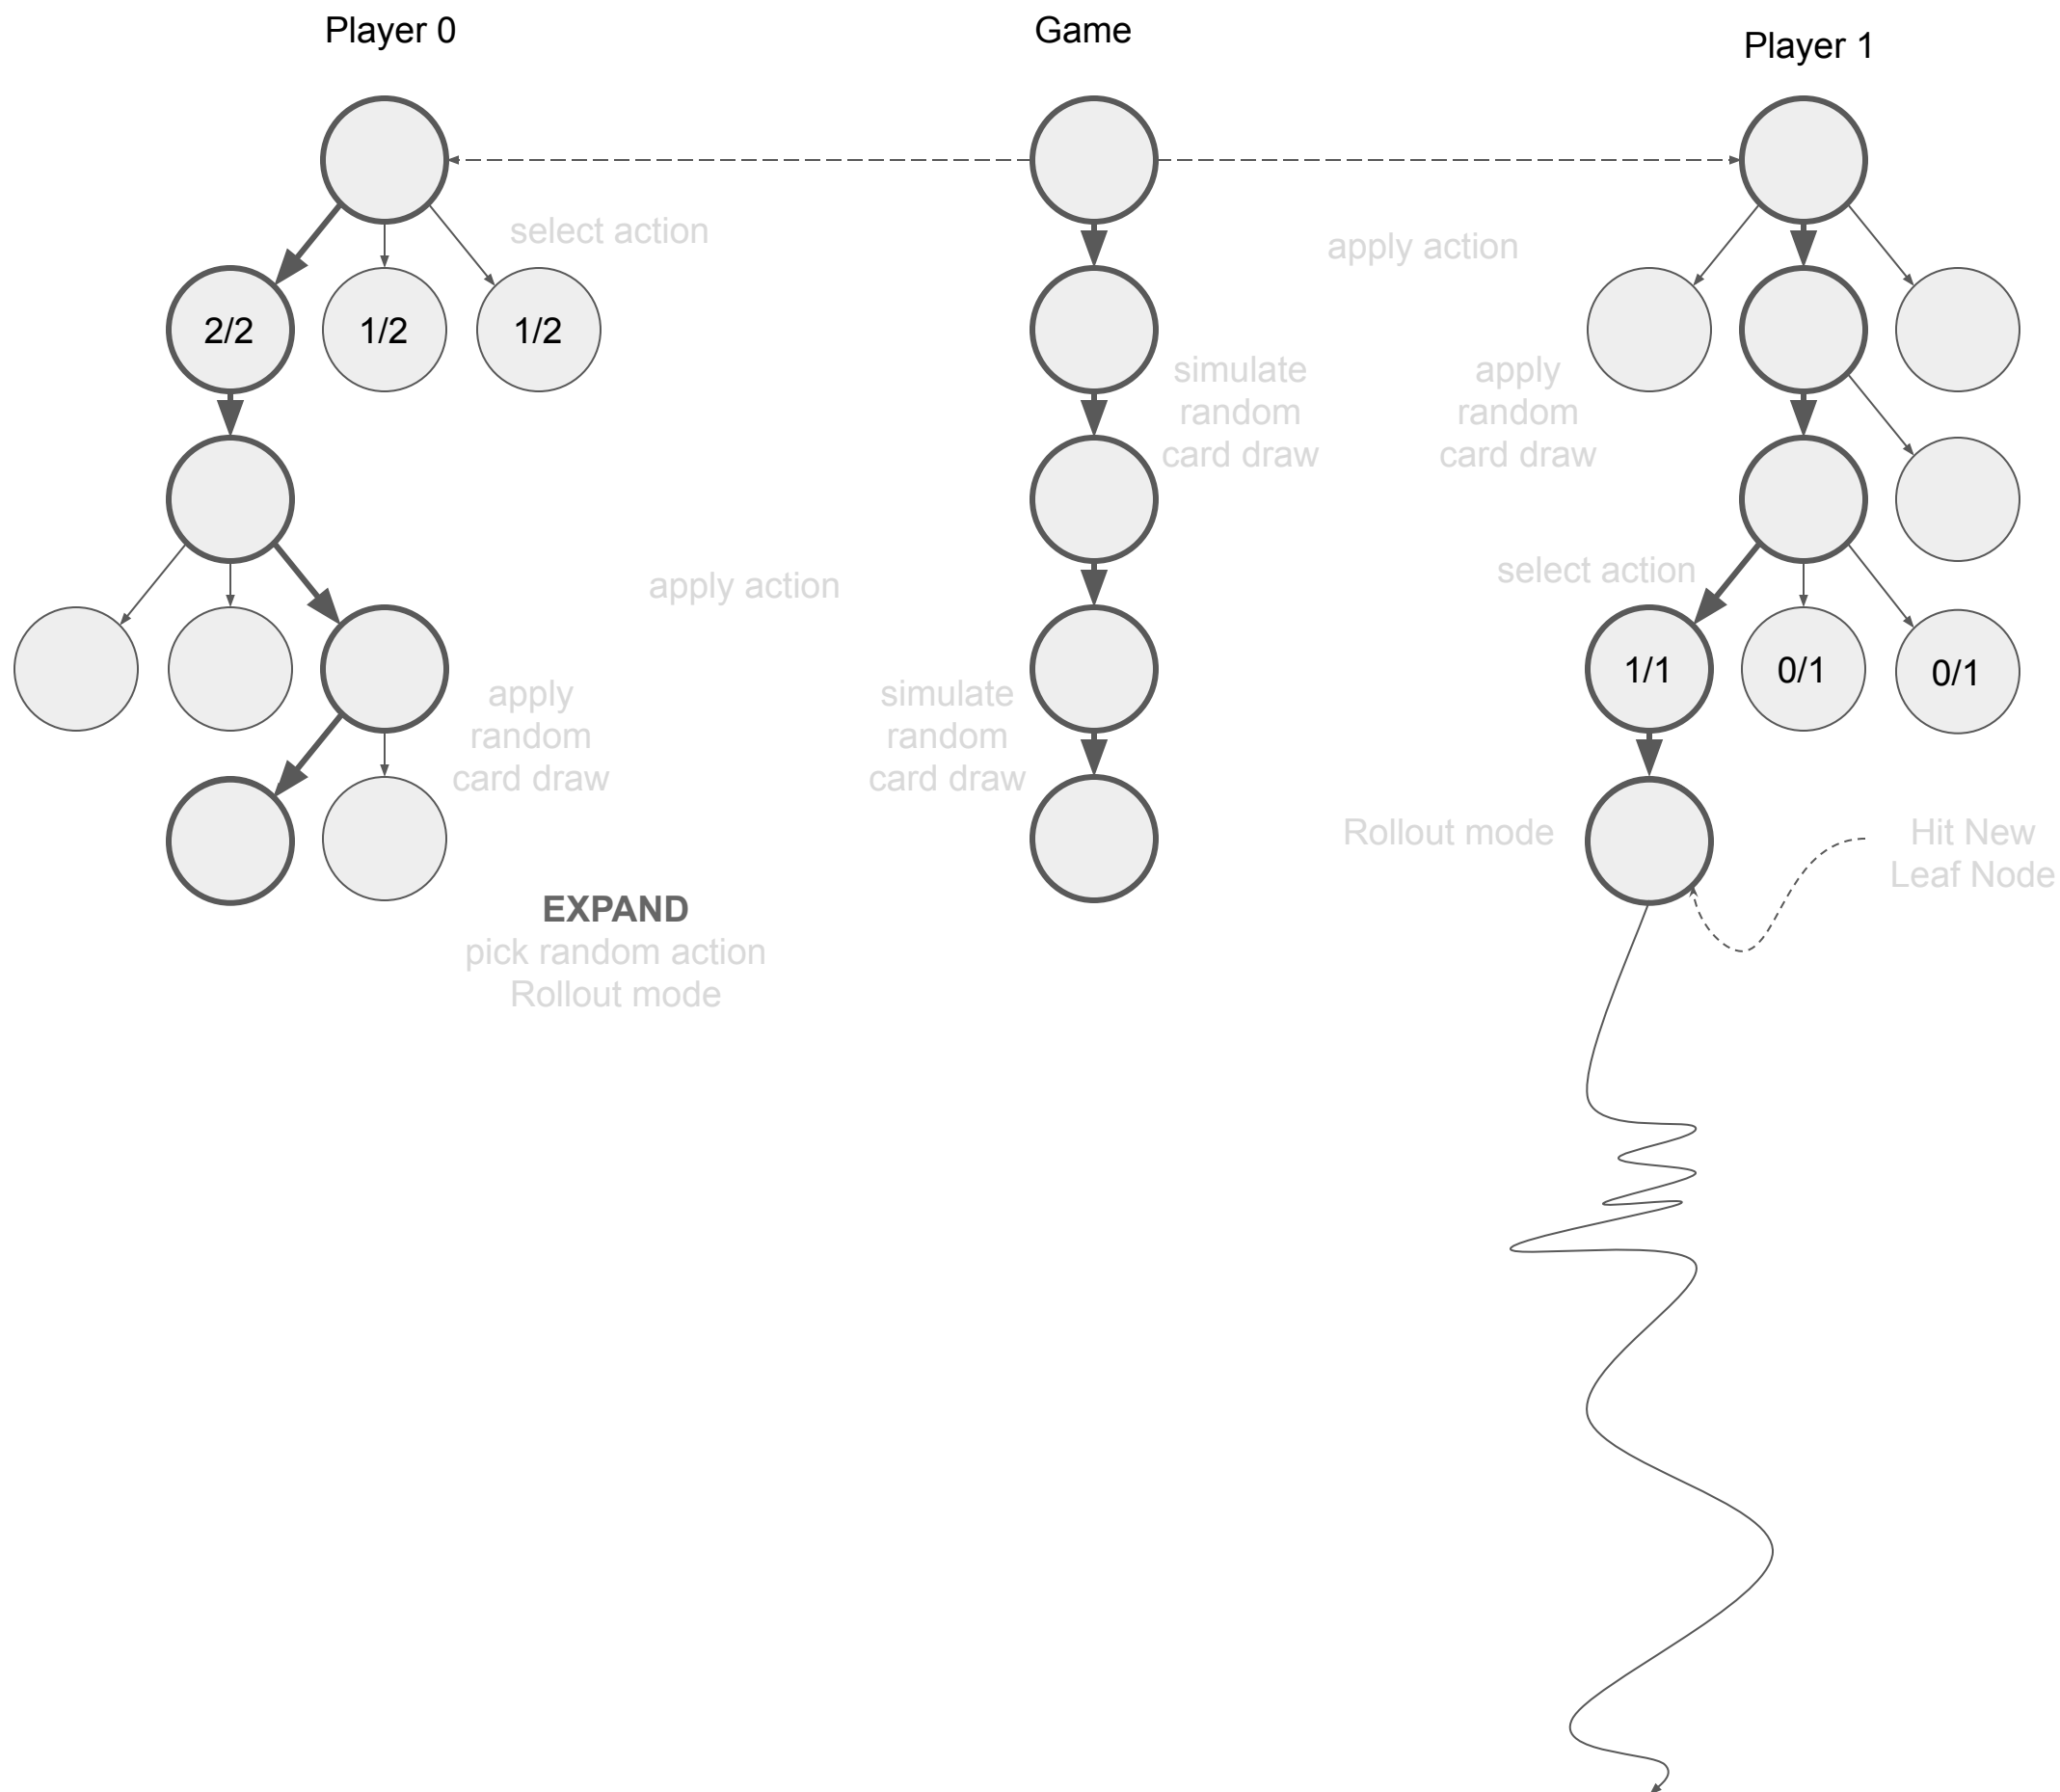

When a new leaf node is sprouted (a neutral node), the tree is set to 'rollout mode'.

Pick random actions  
Don't sprout new nodes

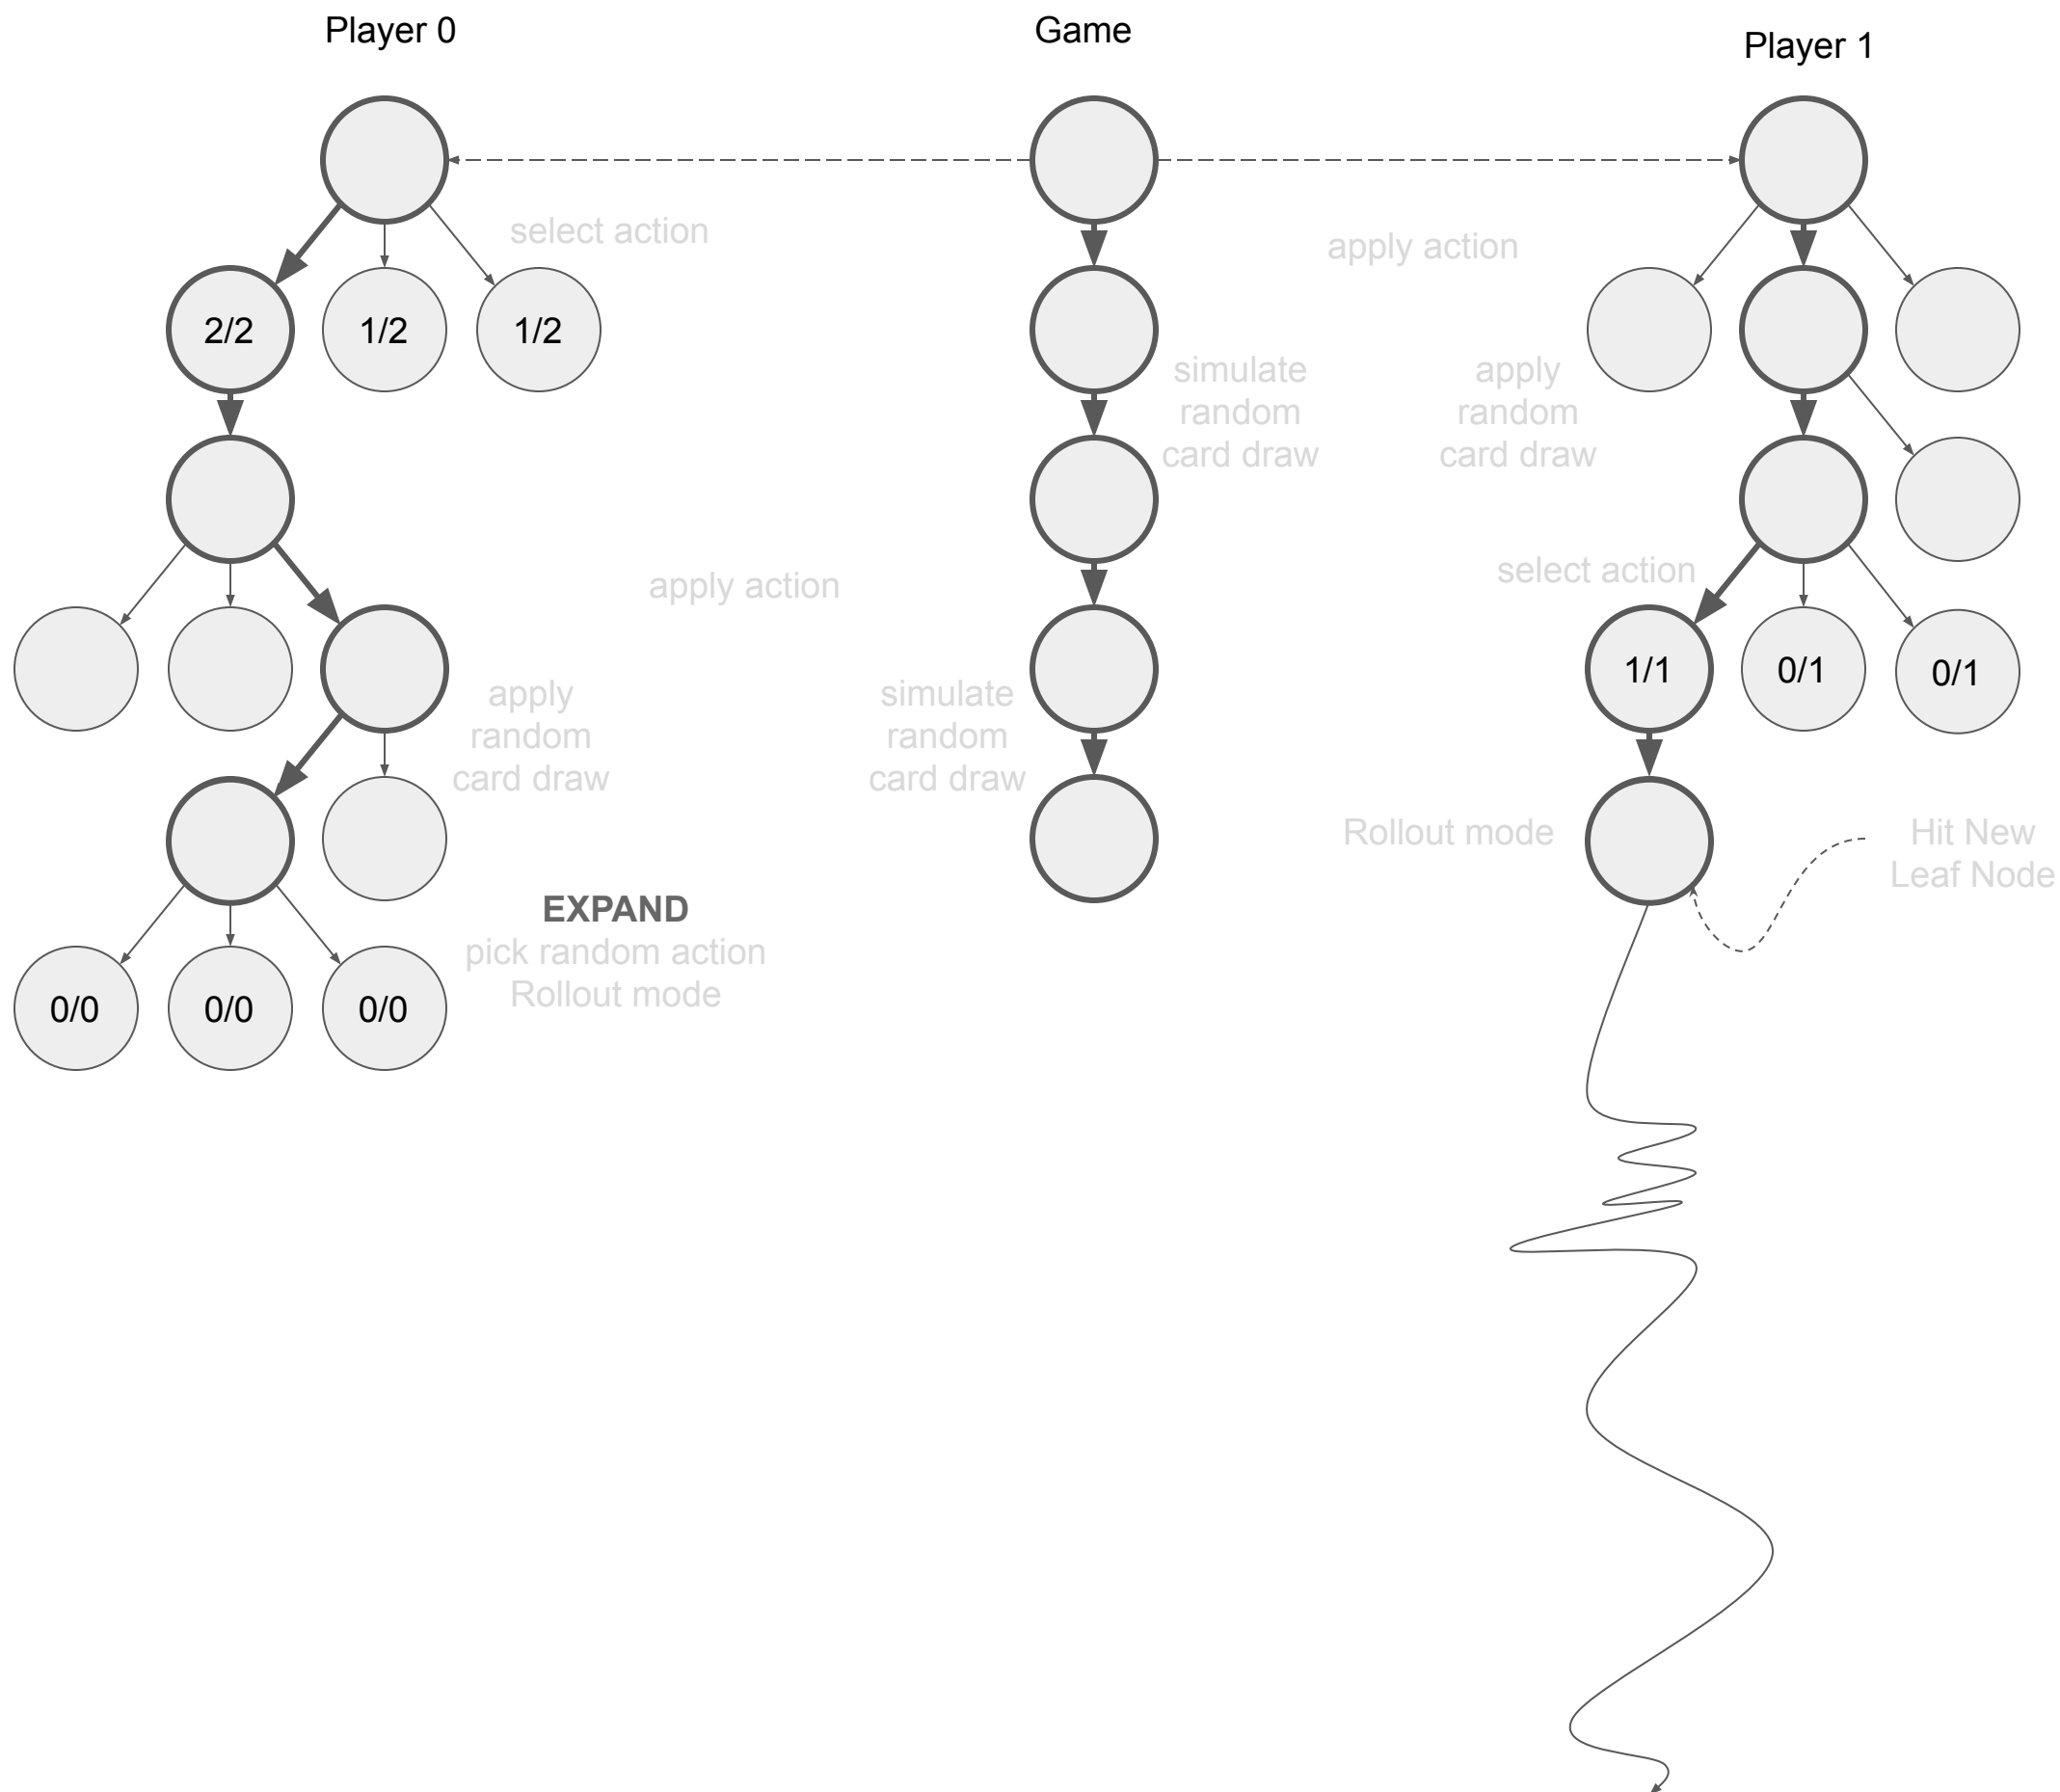

When a new leaf node is sprouted (a neutral node), the tree is set to 'rollout mode'.

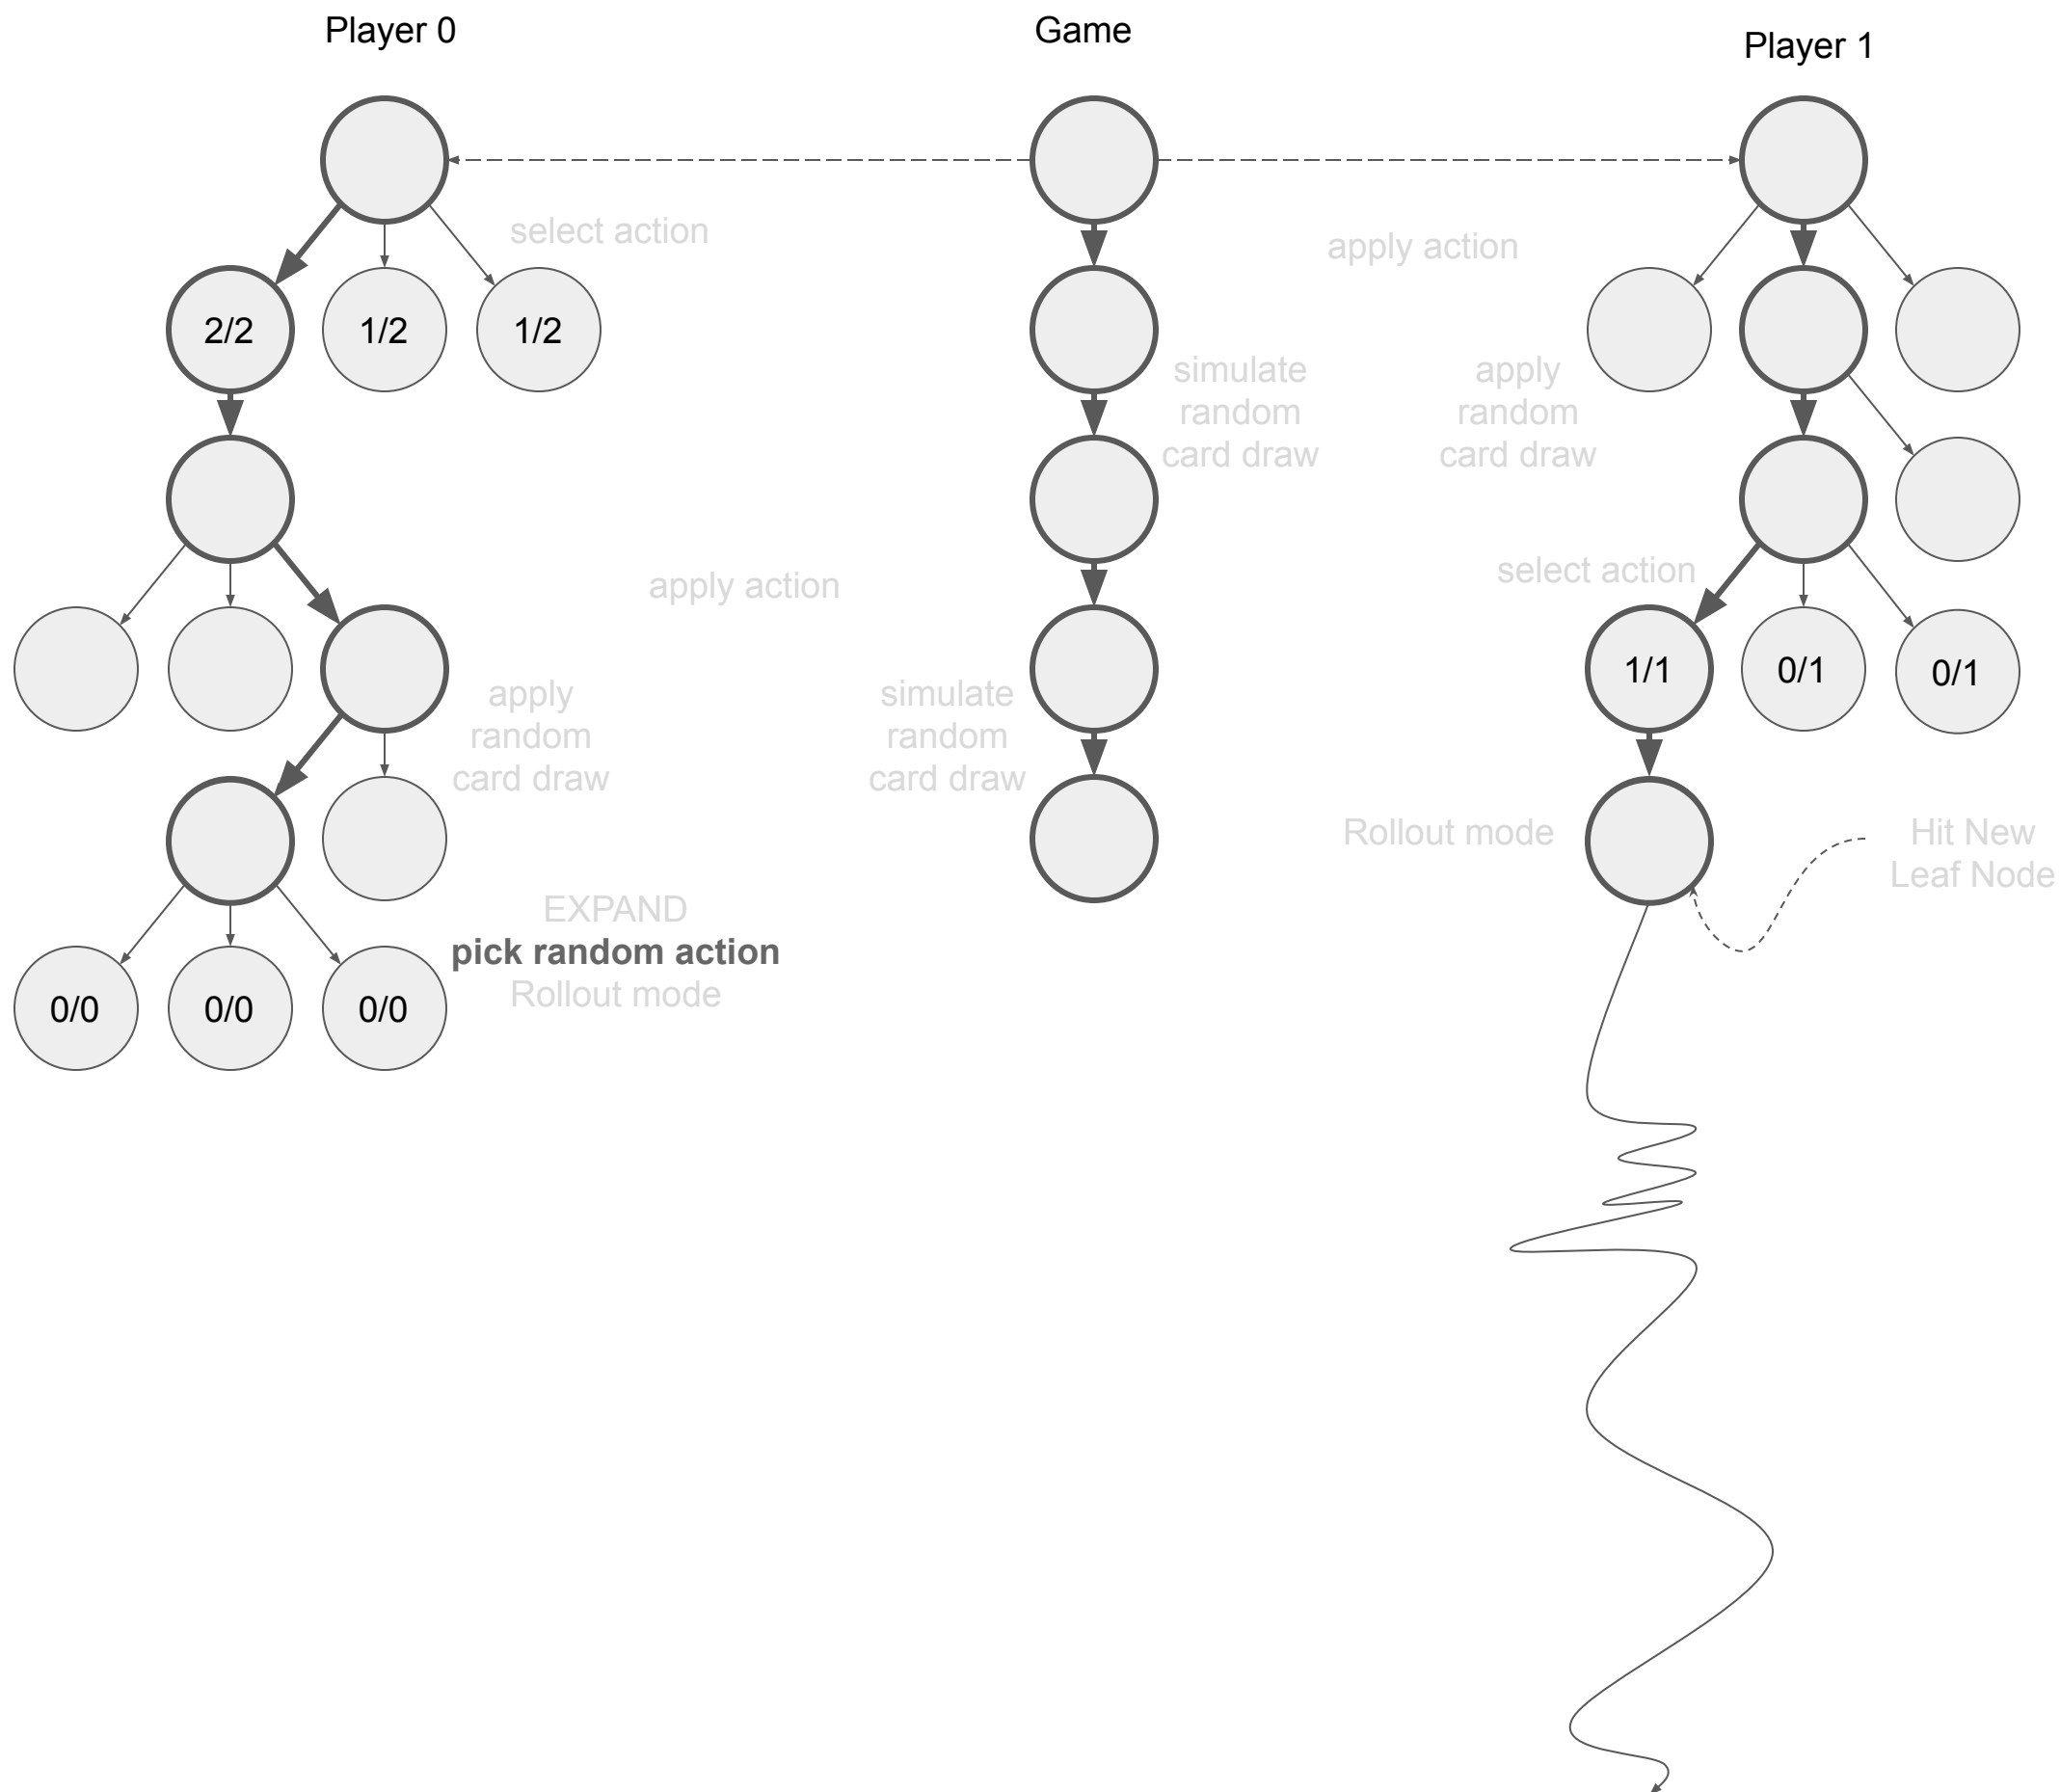

Pick random actions  
Don't sprout new nodes

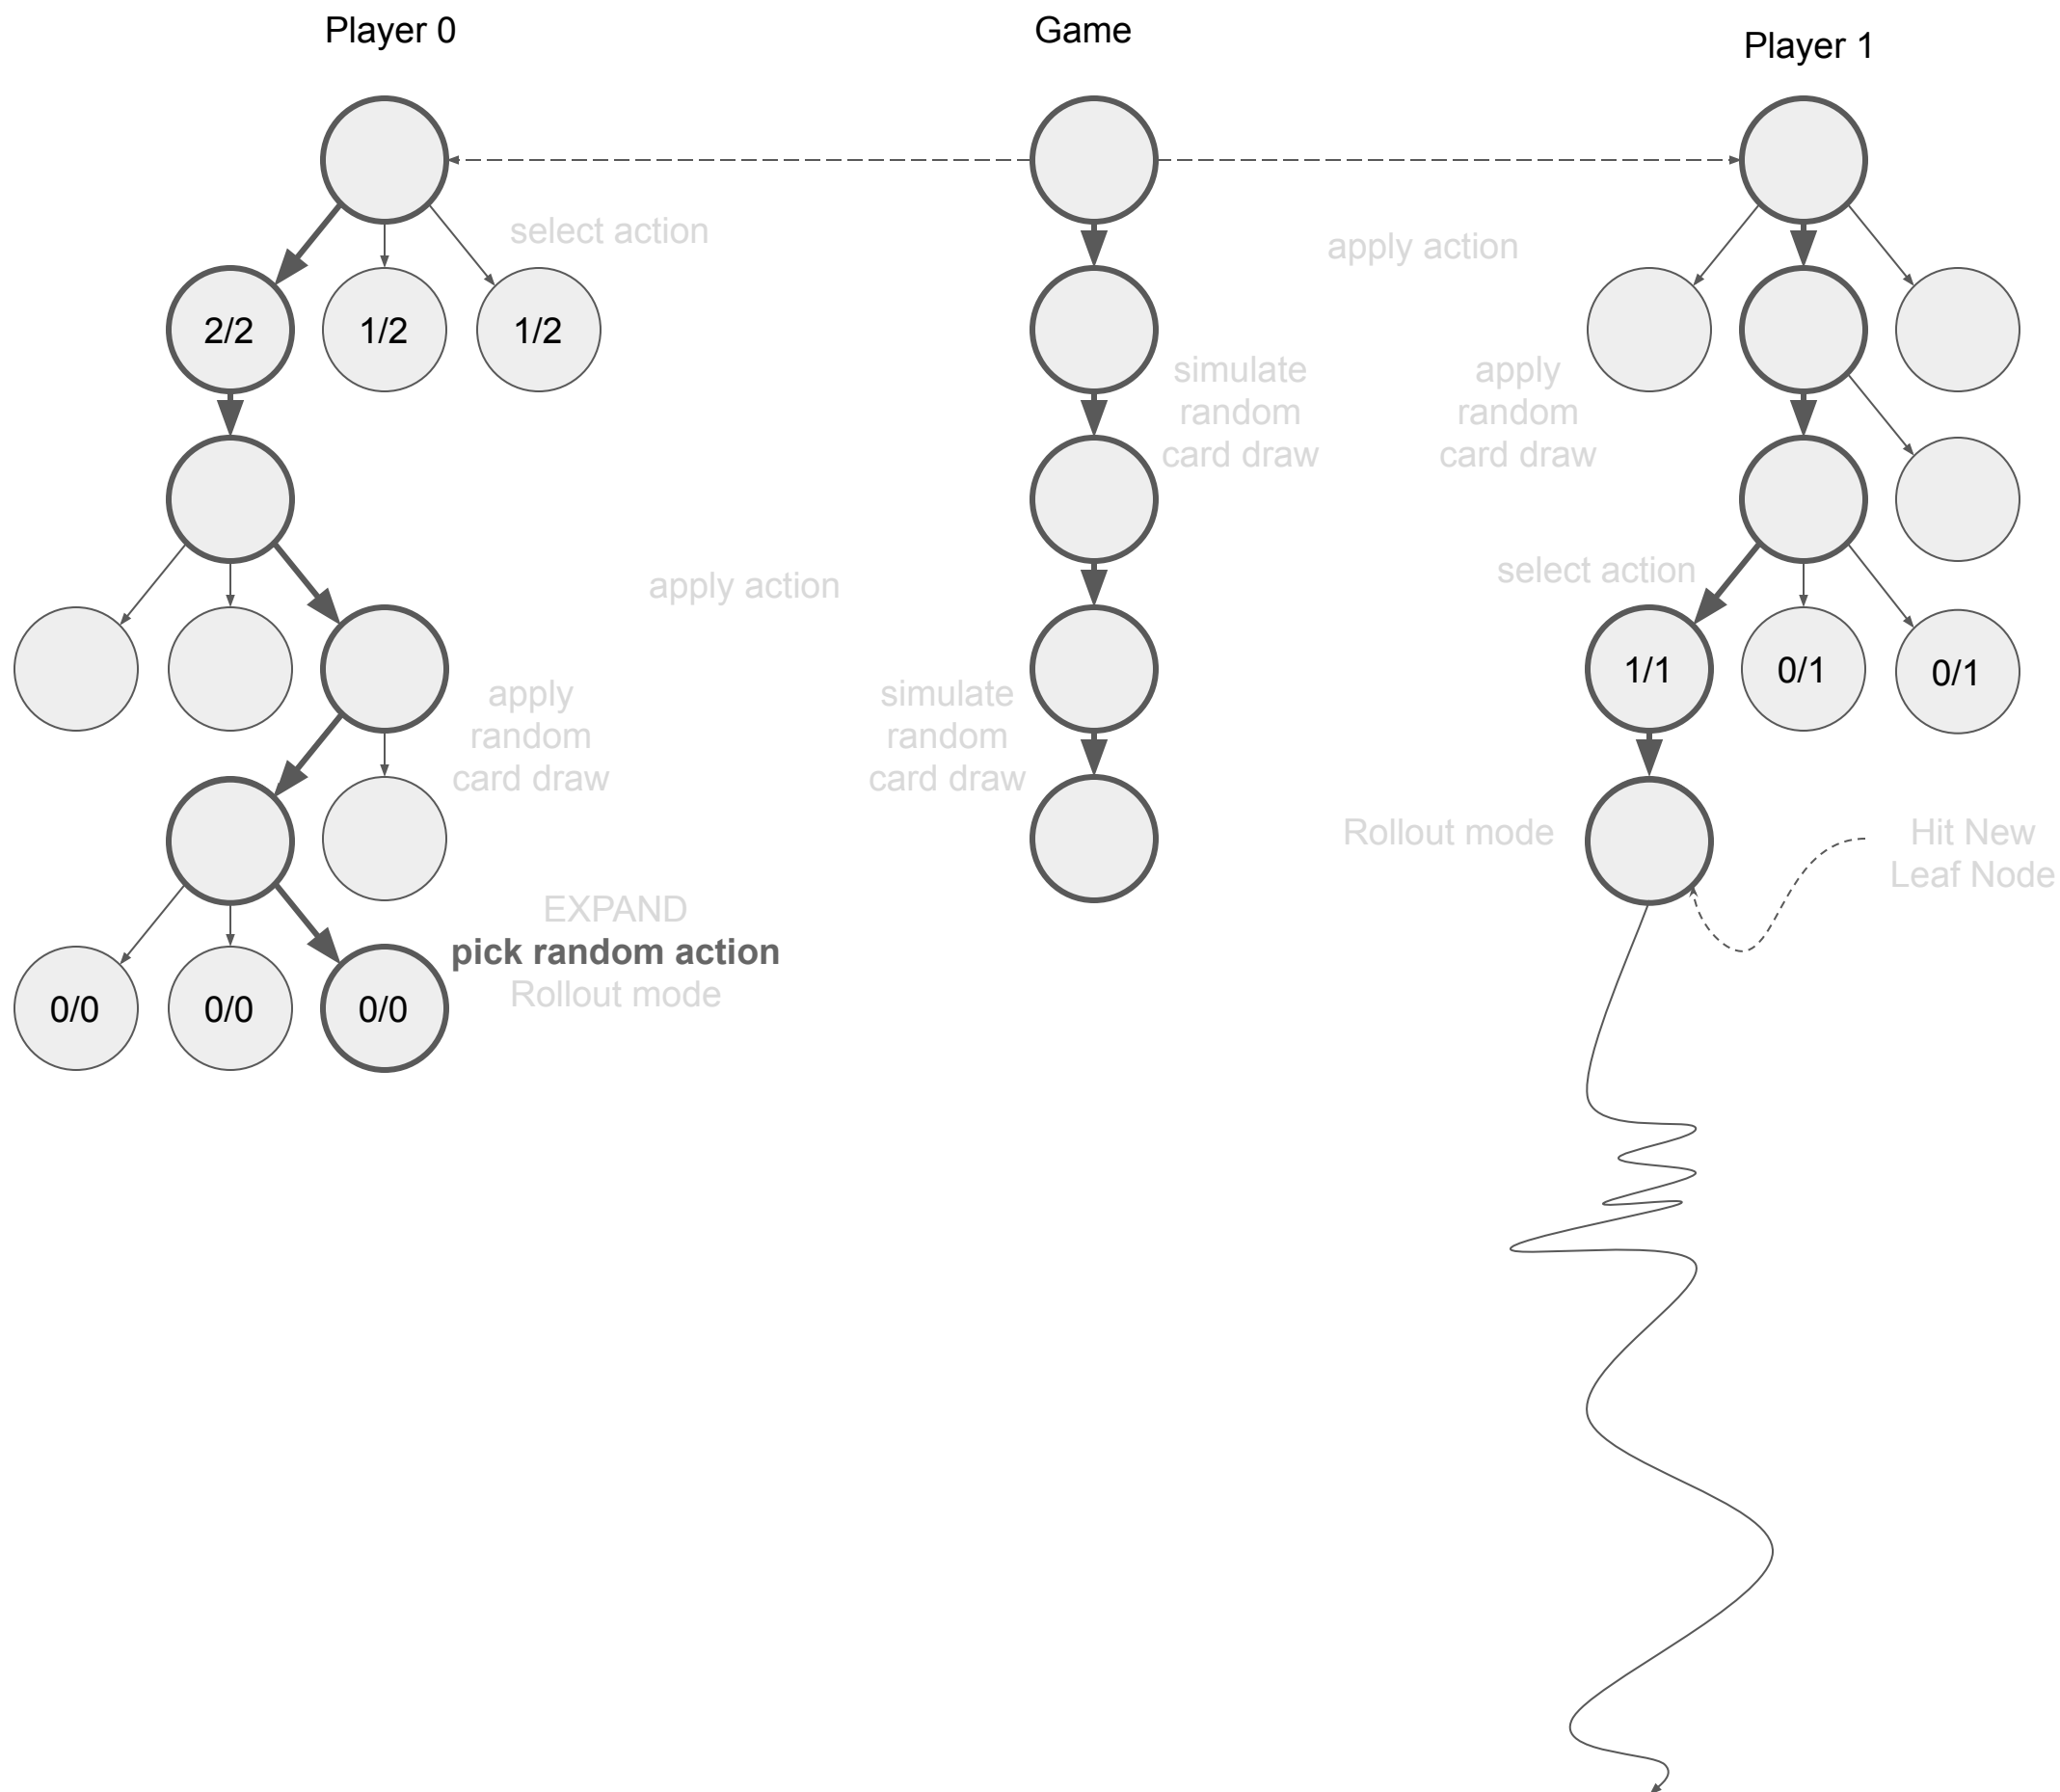

When a leaf neutral node is selected which must sprout a post-action-node;  
 expand the node  
 pick random action  
 put tree to 'rollout mode'

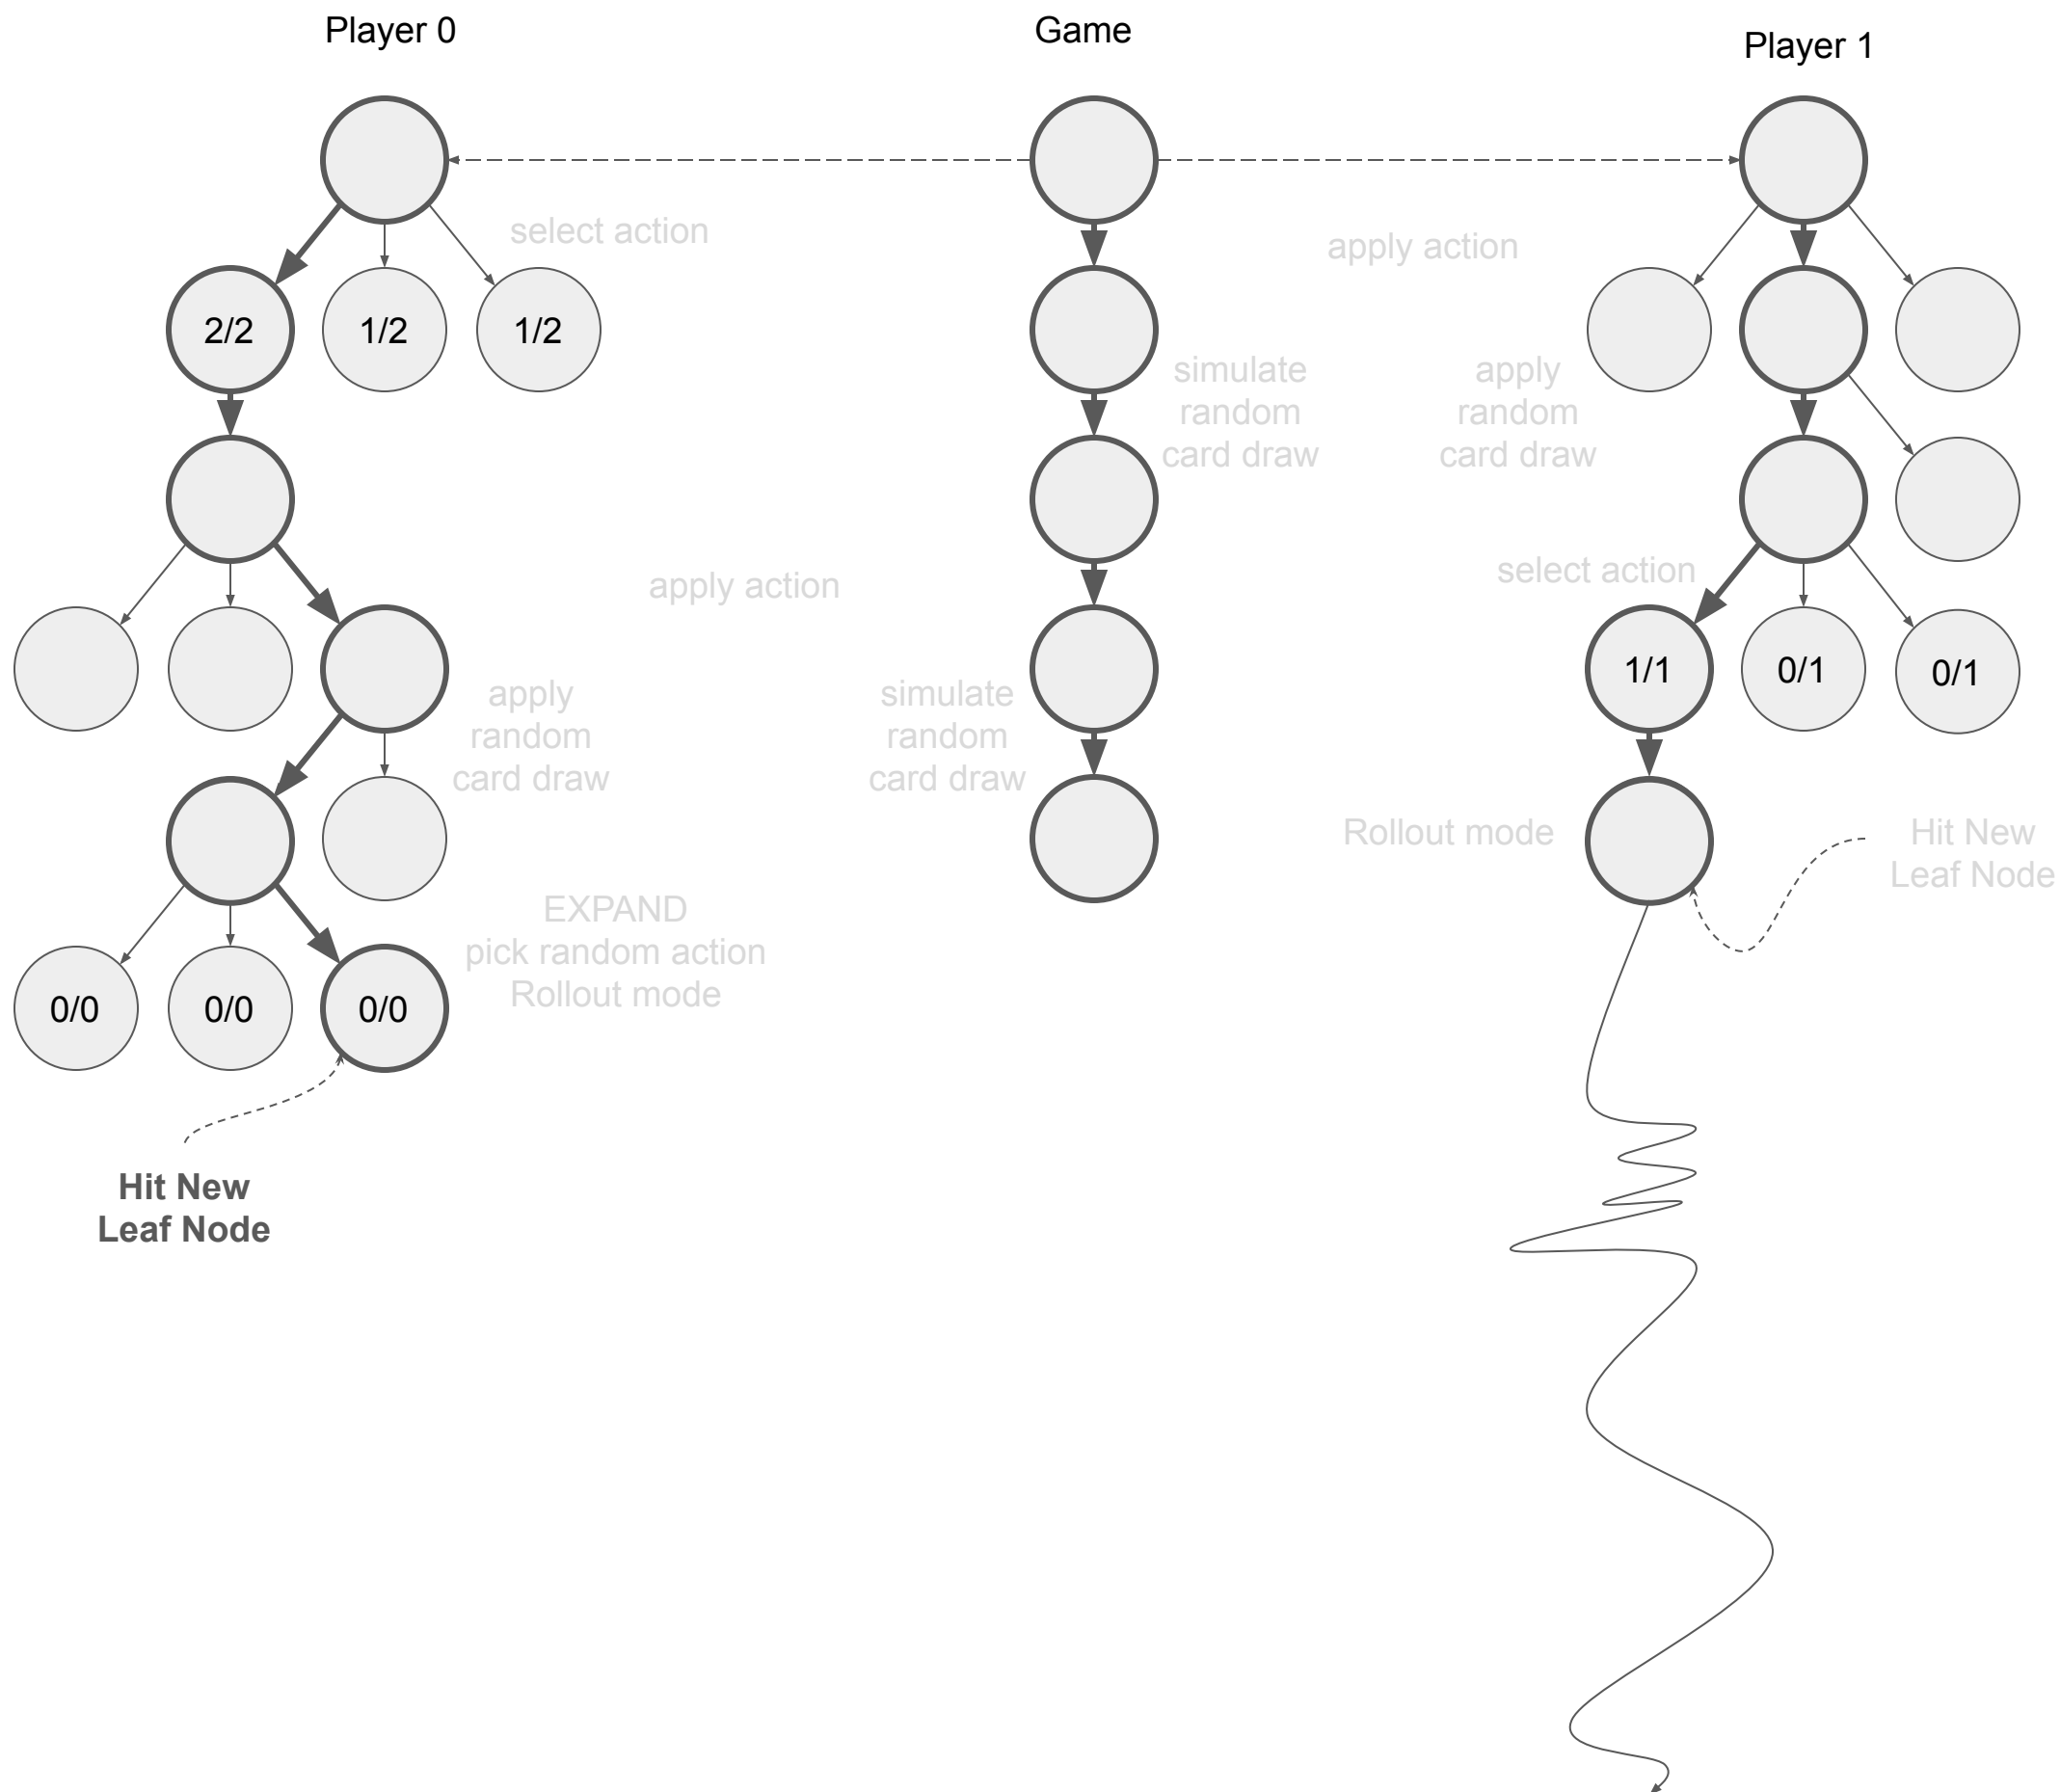

When a leaf neutral node is selected which must sprout a post-action-node;  
 expand the node  
 pick random action  
 put tree to 'rollout mode'

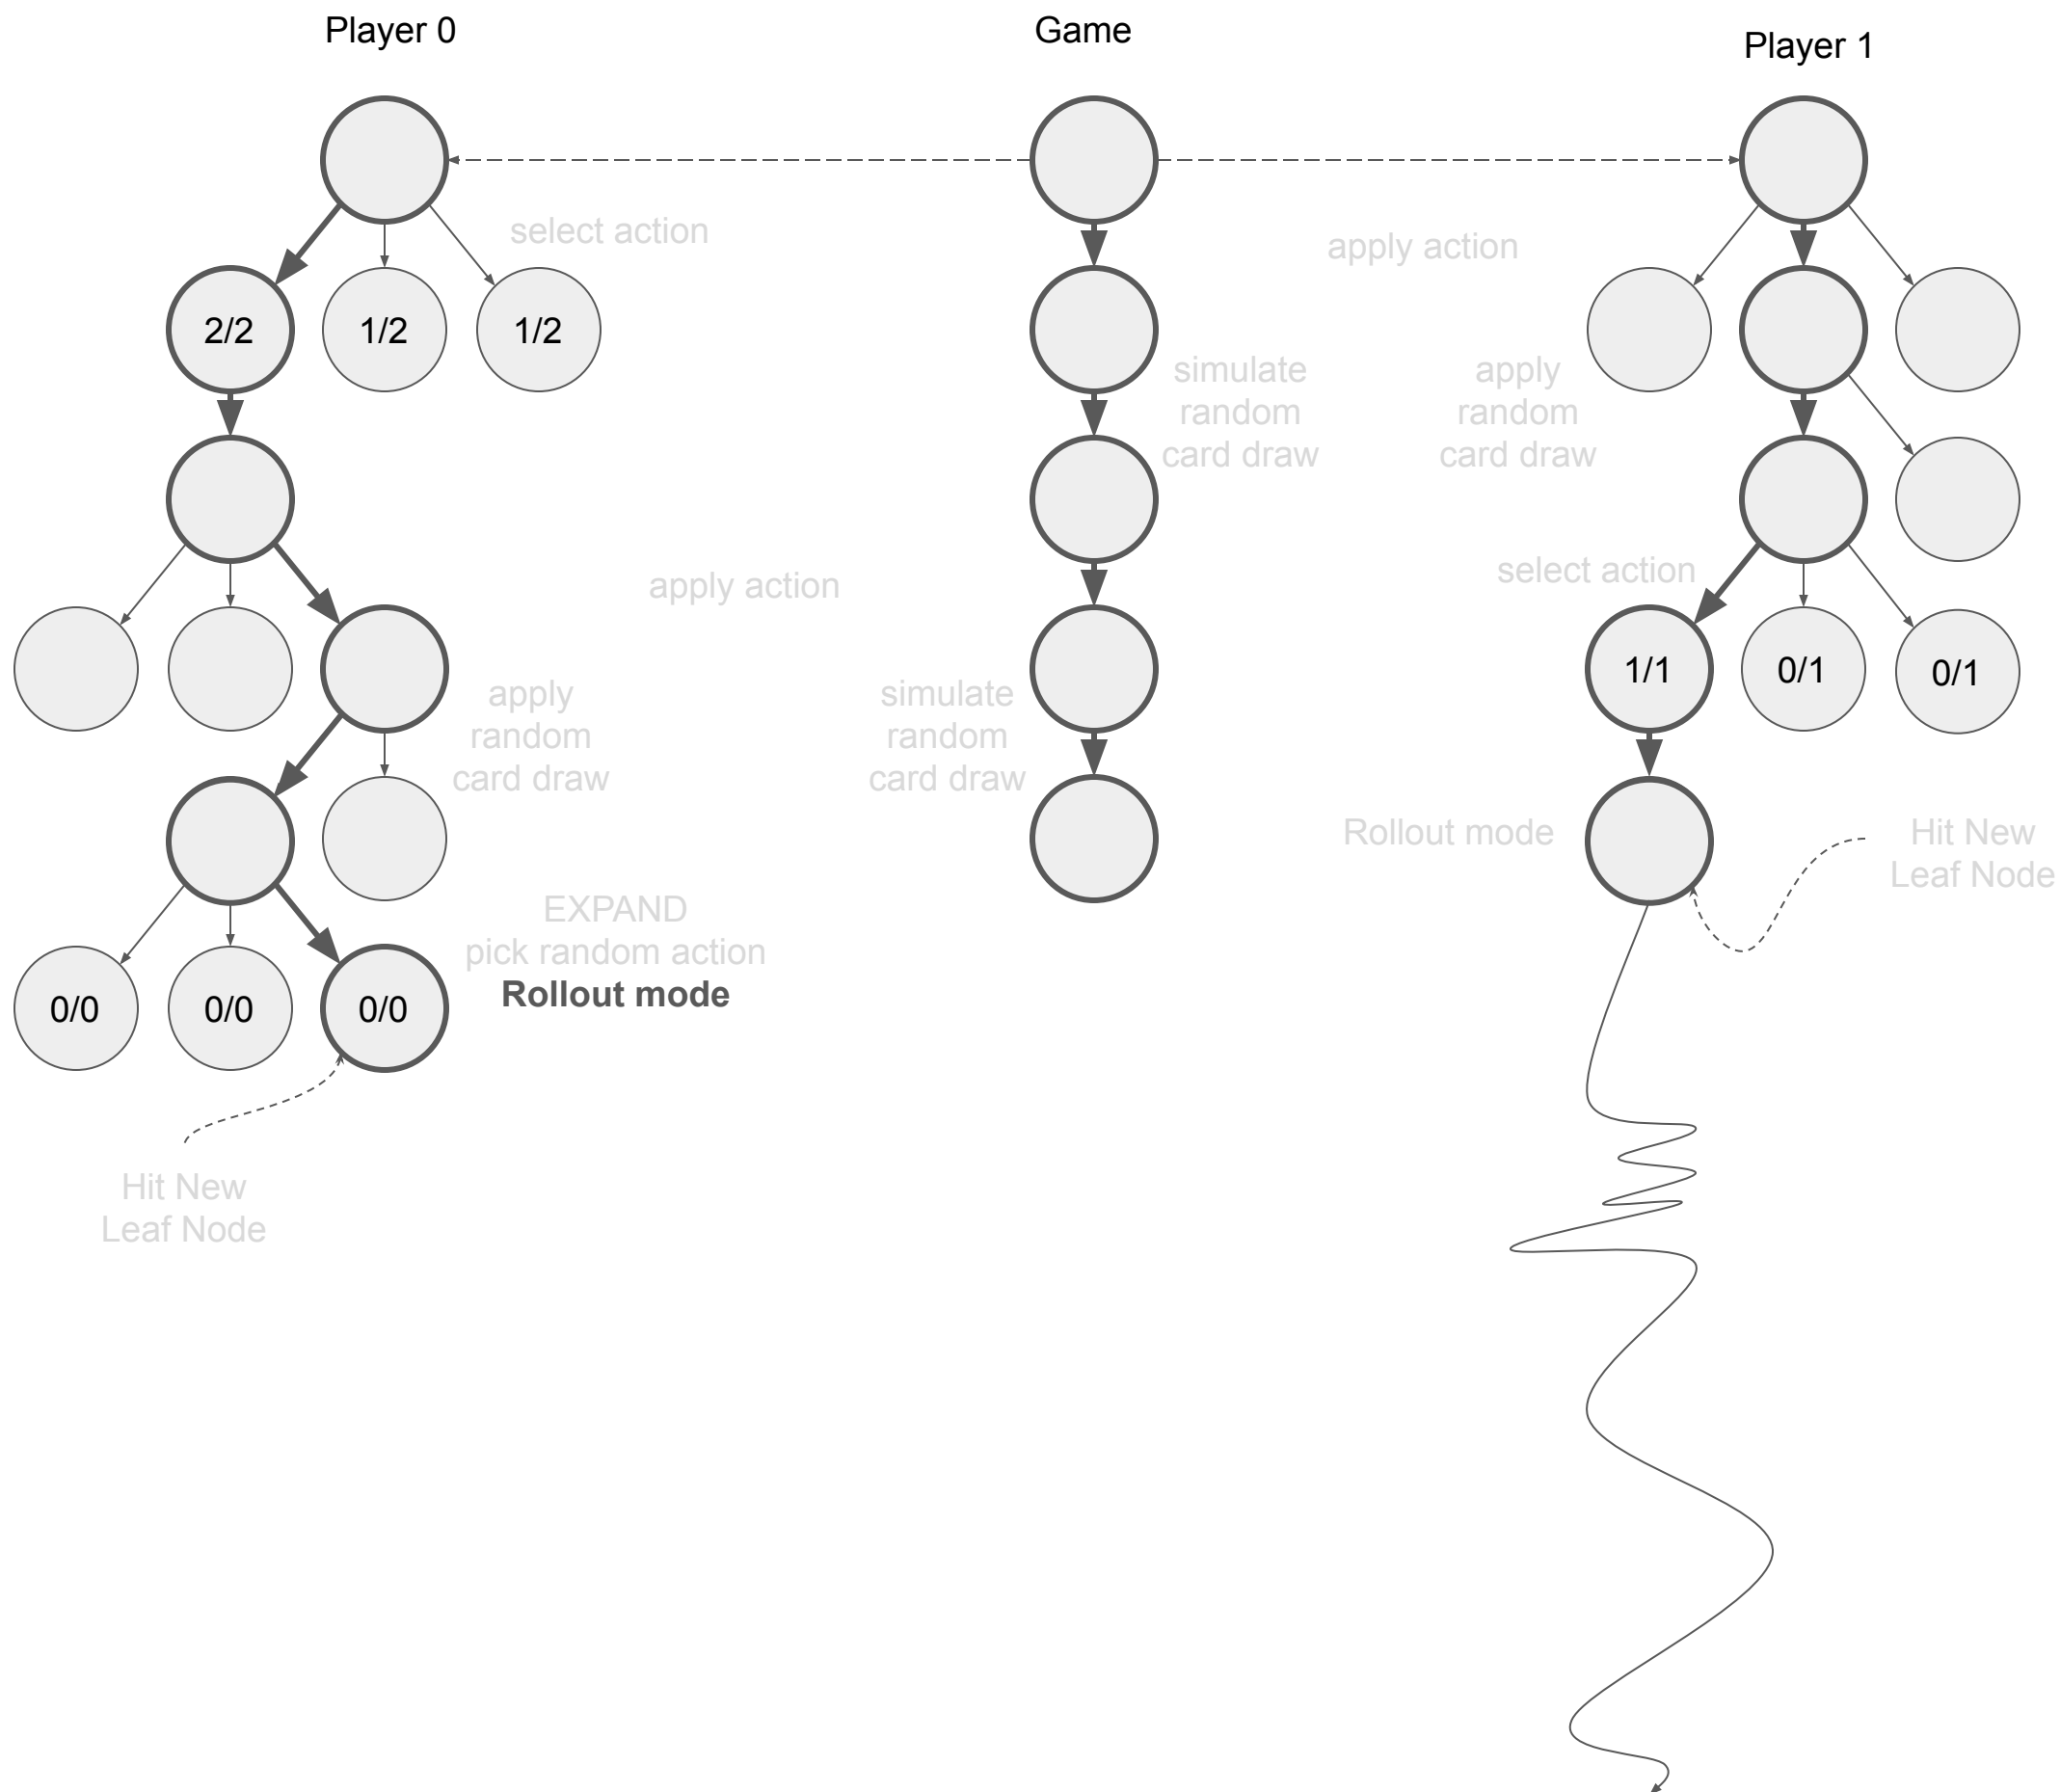

When a leaf neutral node is selected which must sprout a post-action-node;  
 expand the node  
 pick random action  
 put tree to 'rollout mode'

When a leaf neutral node is selected which must sprout a post-action-node;  
 expand the node  
 pick random action  
 put tree to 'rollout mode'

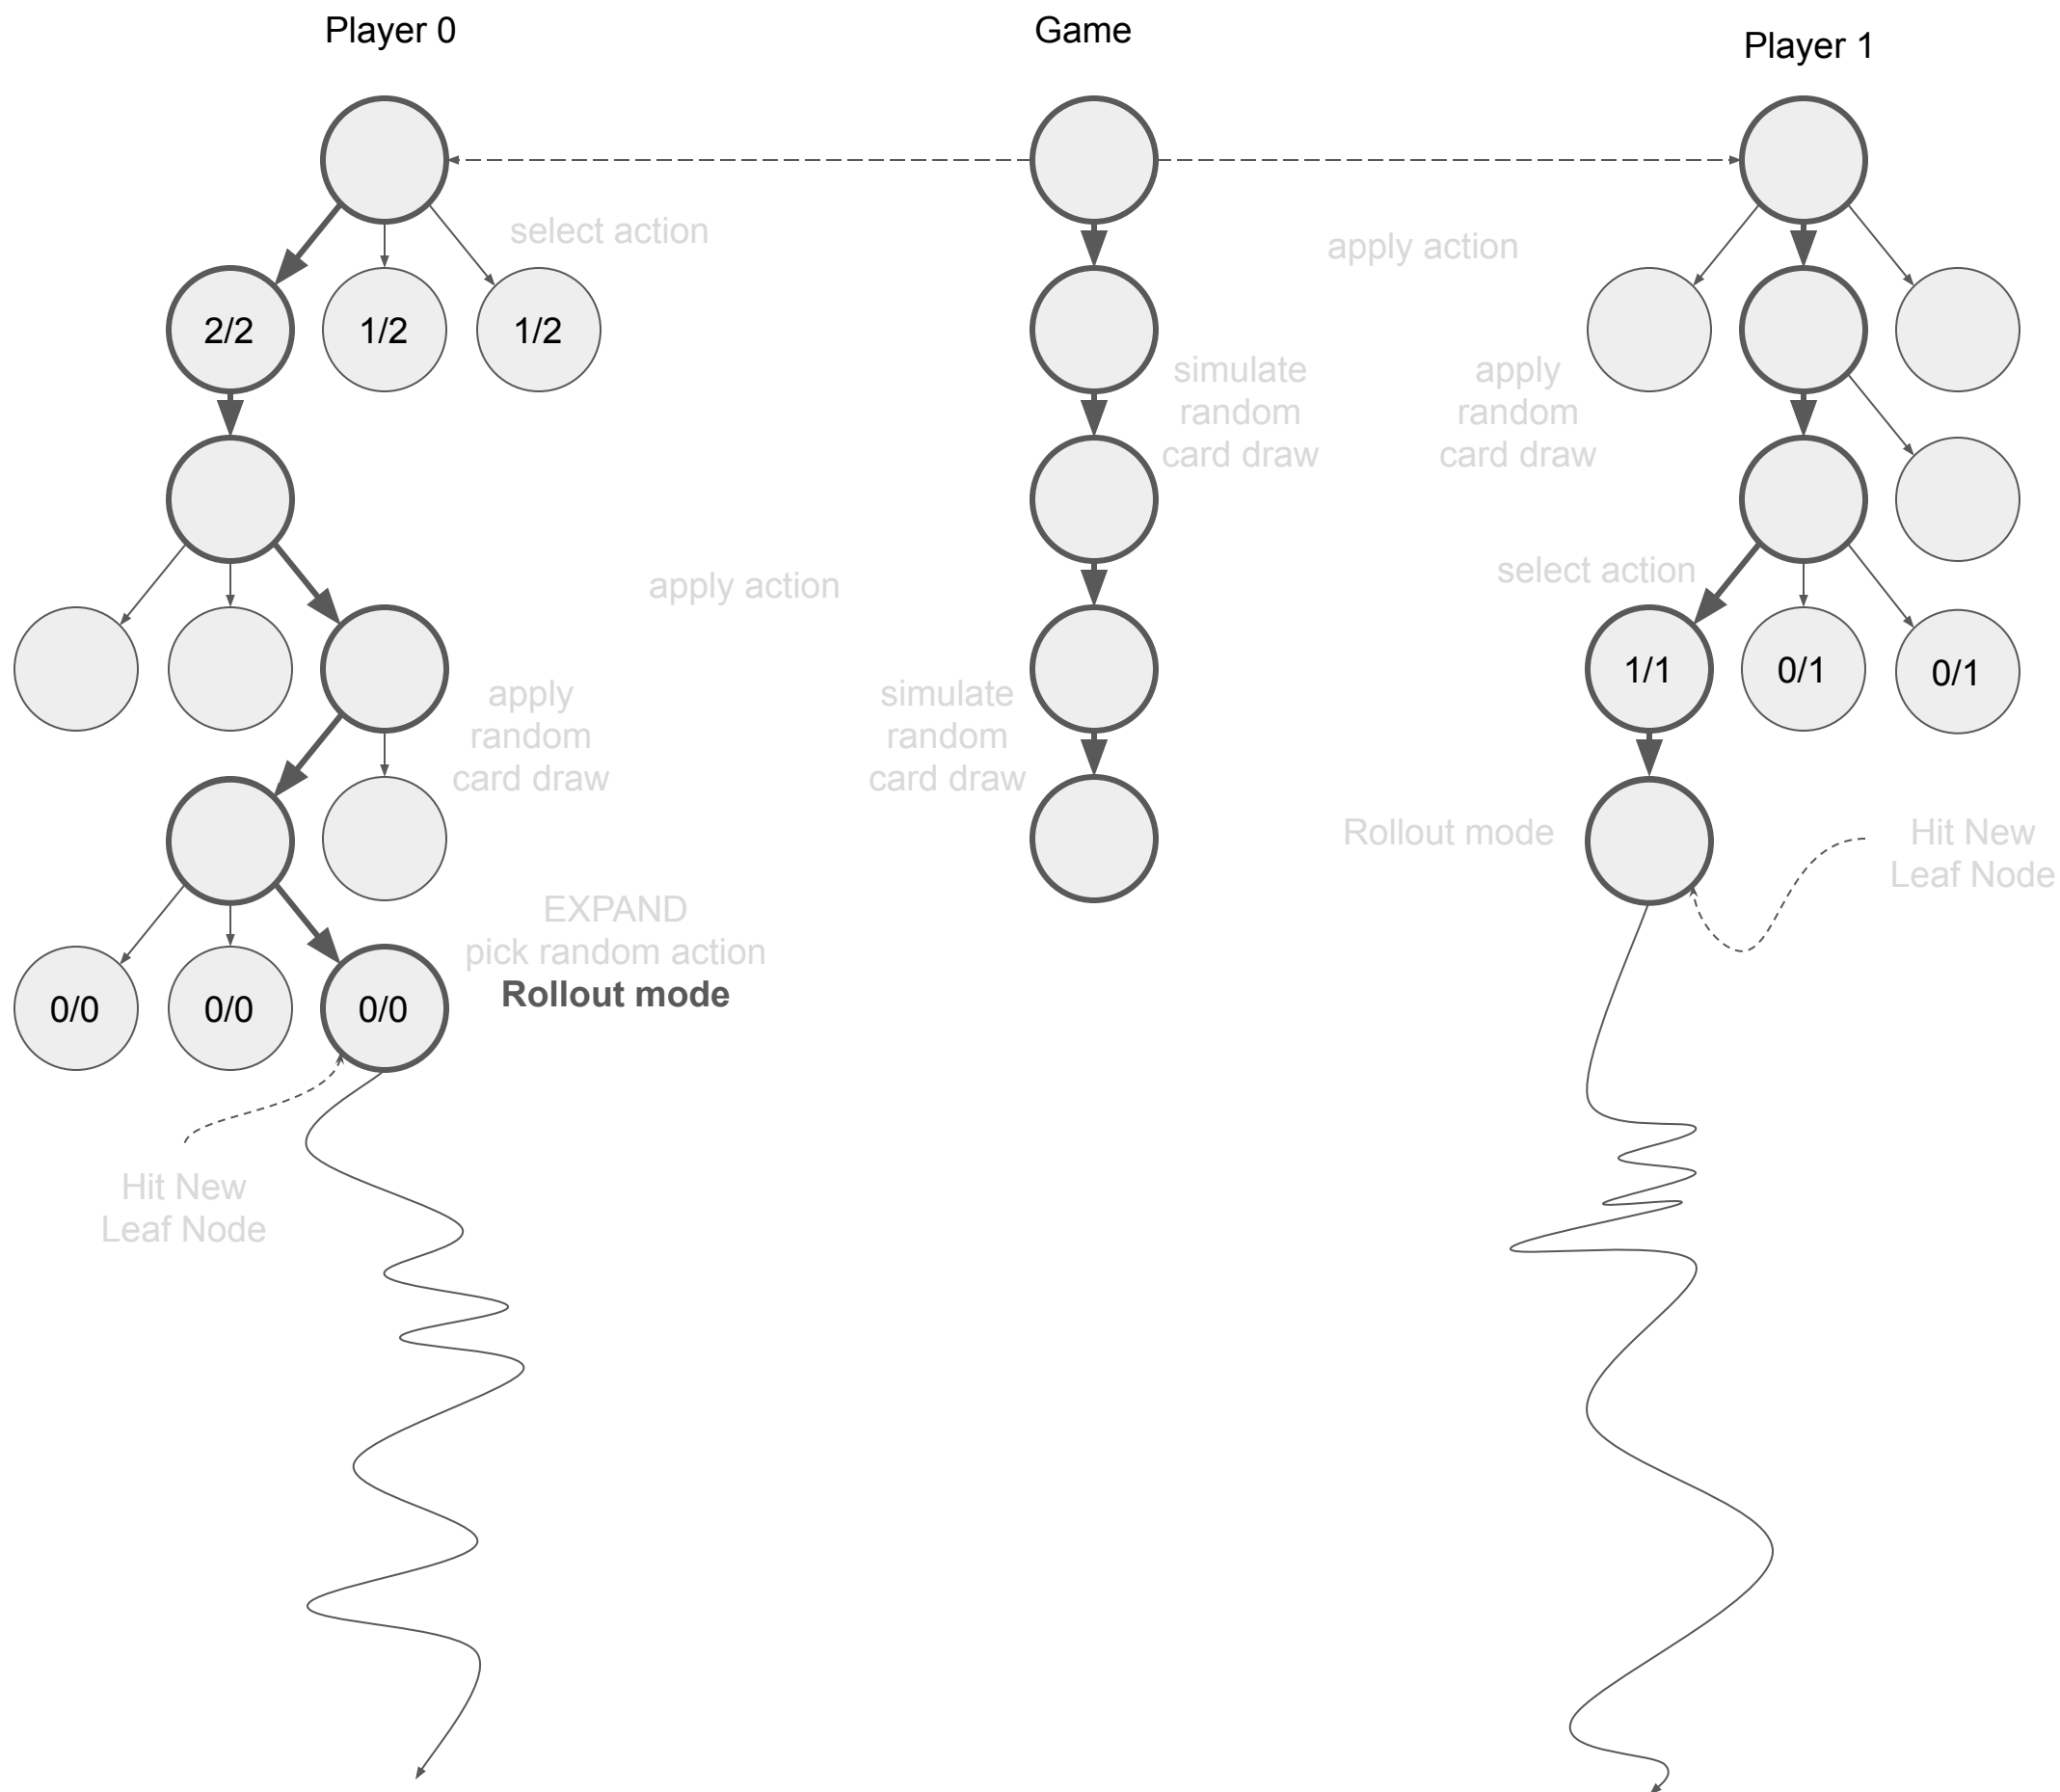

When a leaf neutral node is selected which must sprout a post-action-node;  
 expand the node  
 pick random action  
 put tree to 'rollout mode'

Put tree to 'rollout mode'  
 Pick random actions  
 Don't sprout new nodes

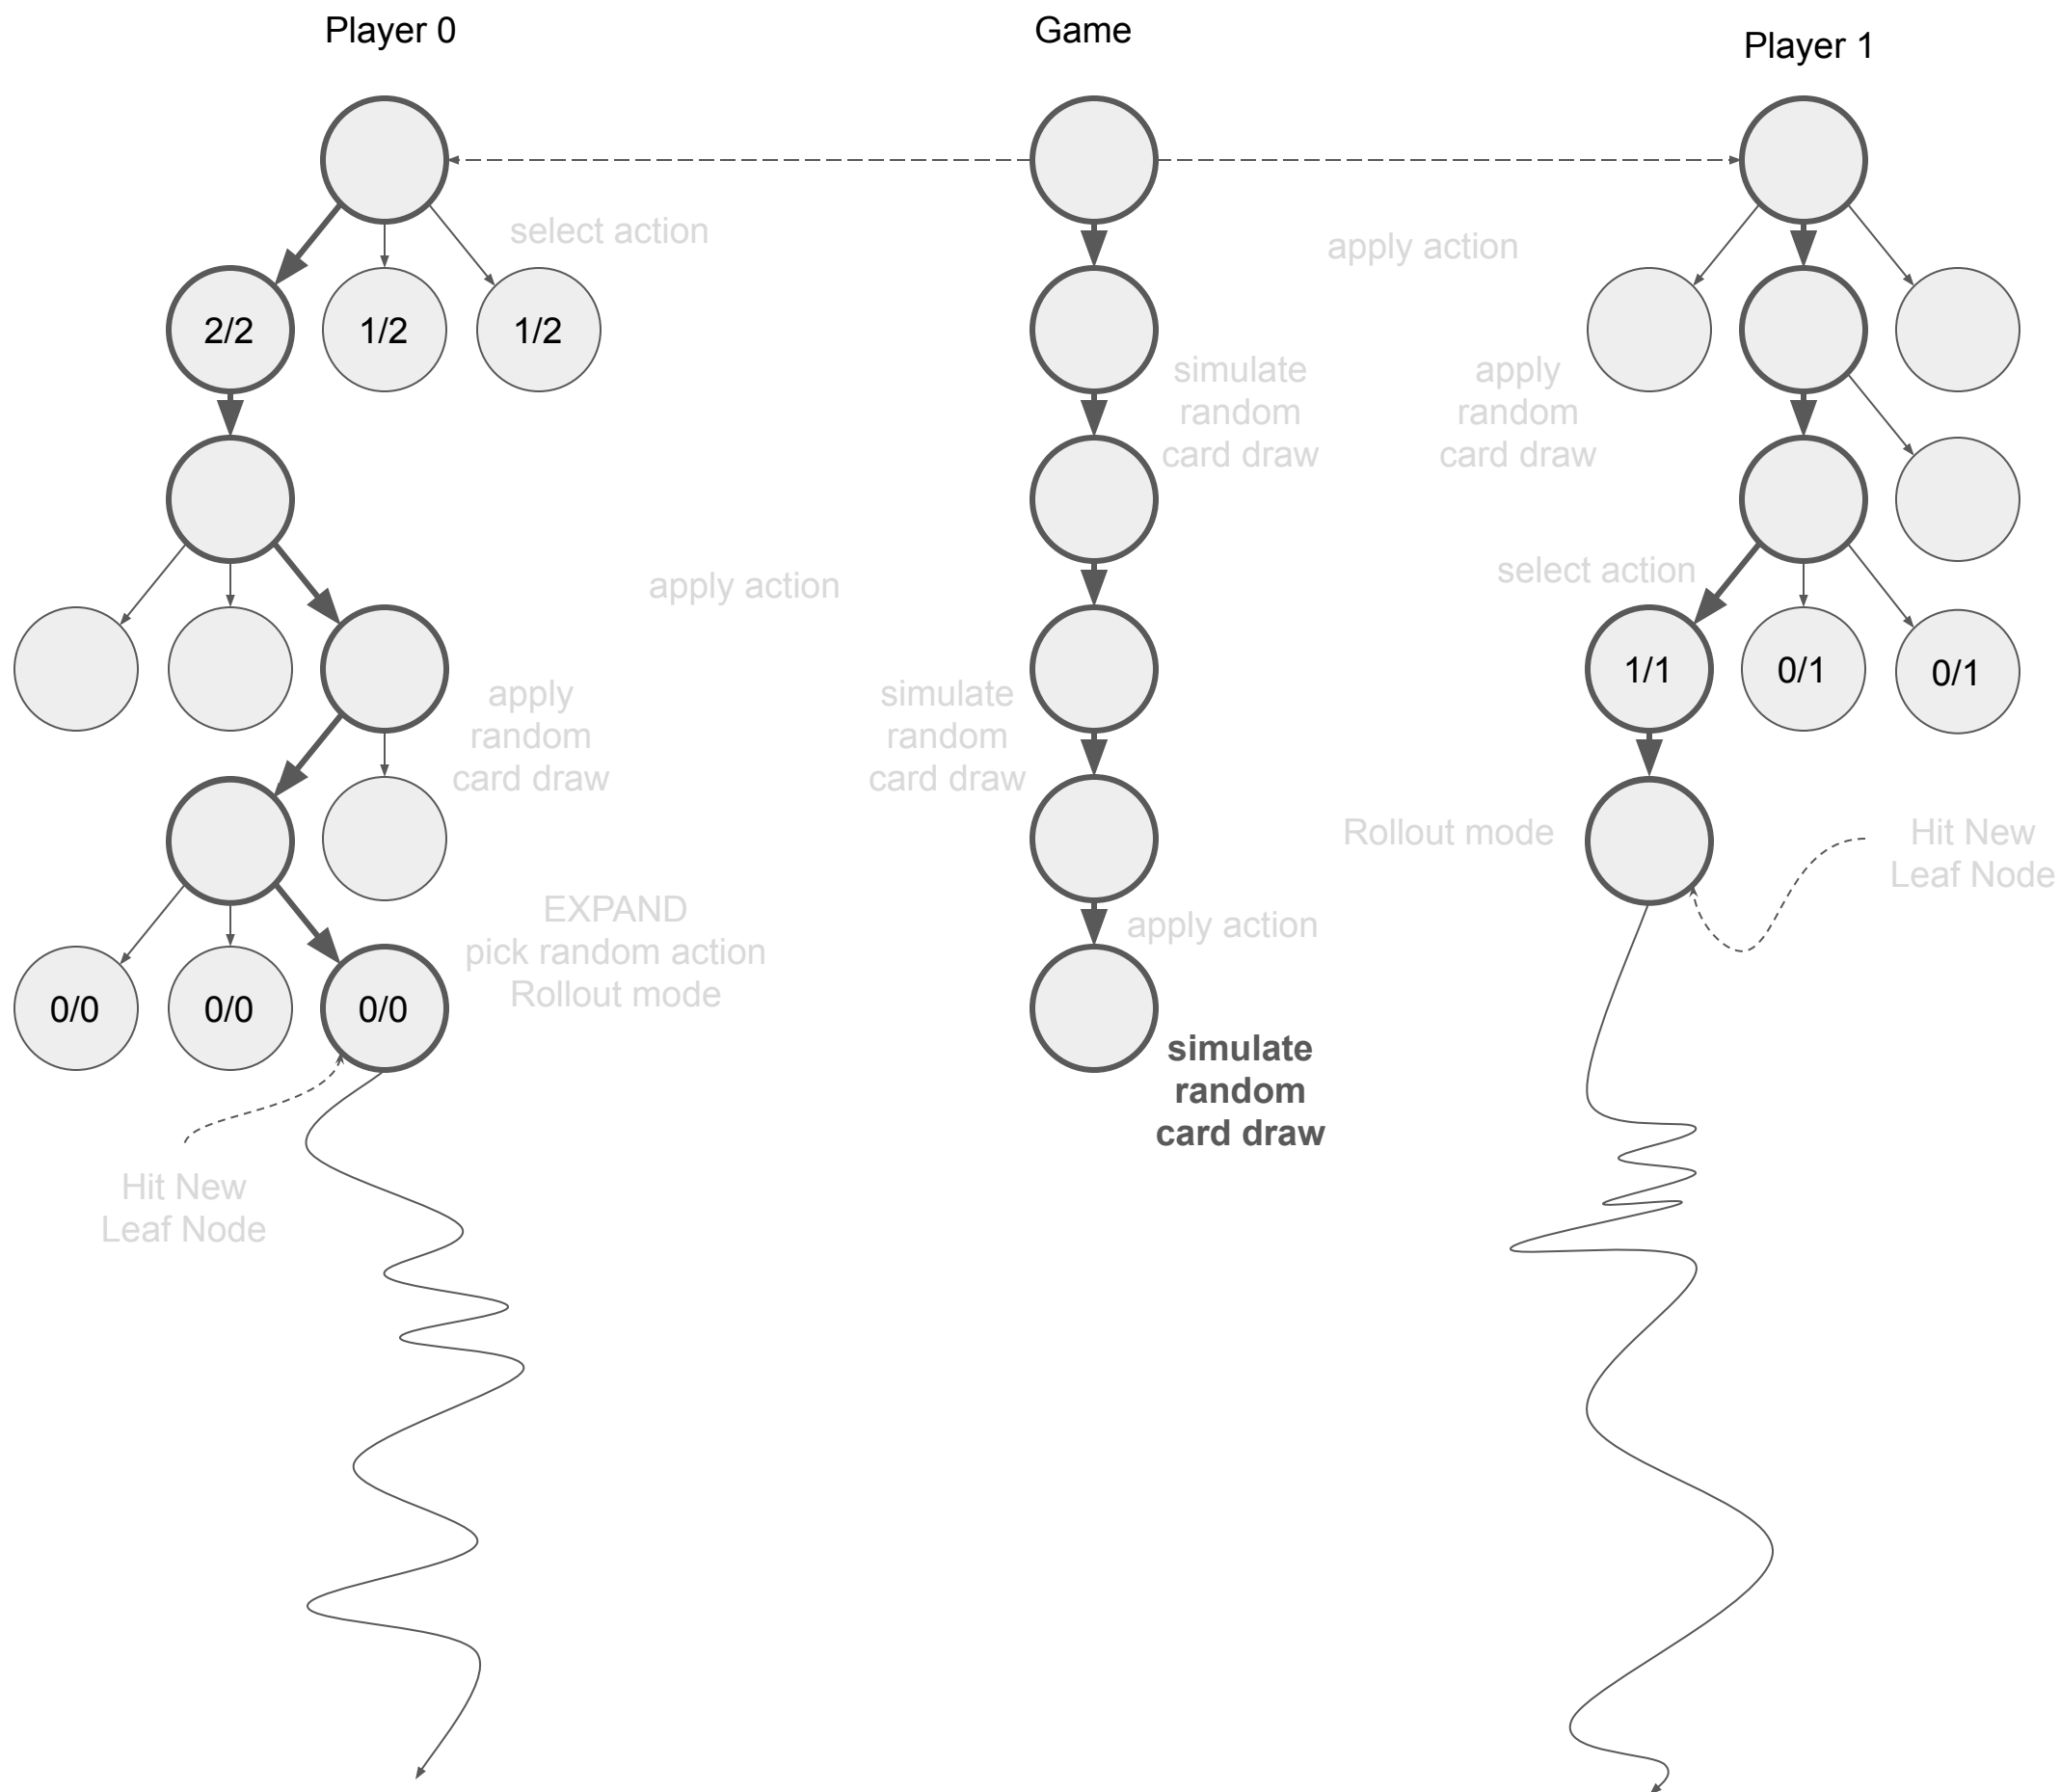

Put tree to 'rollout mode'  
 Pick random actions  
 Don't sprout new nodes

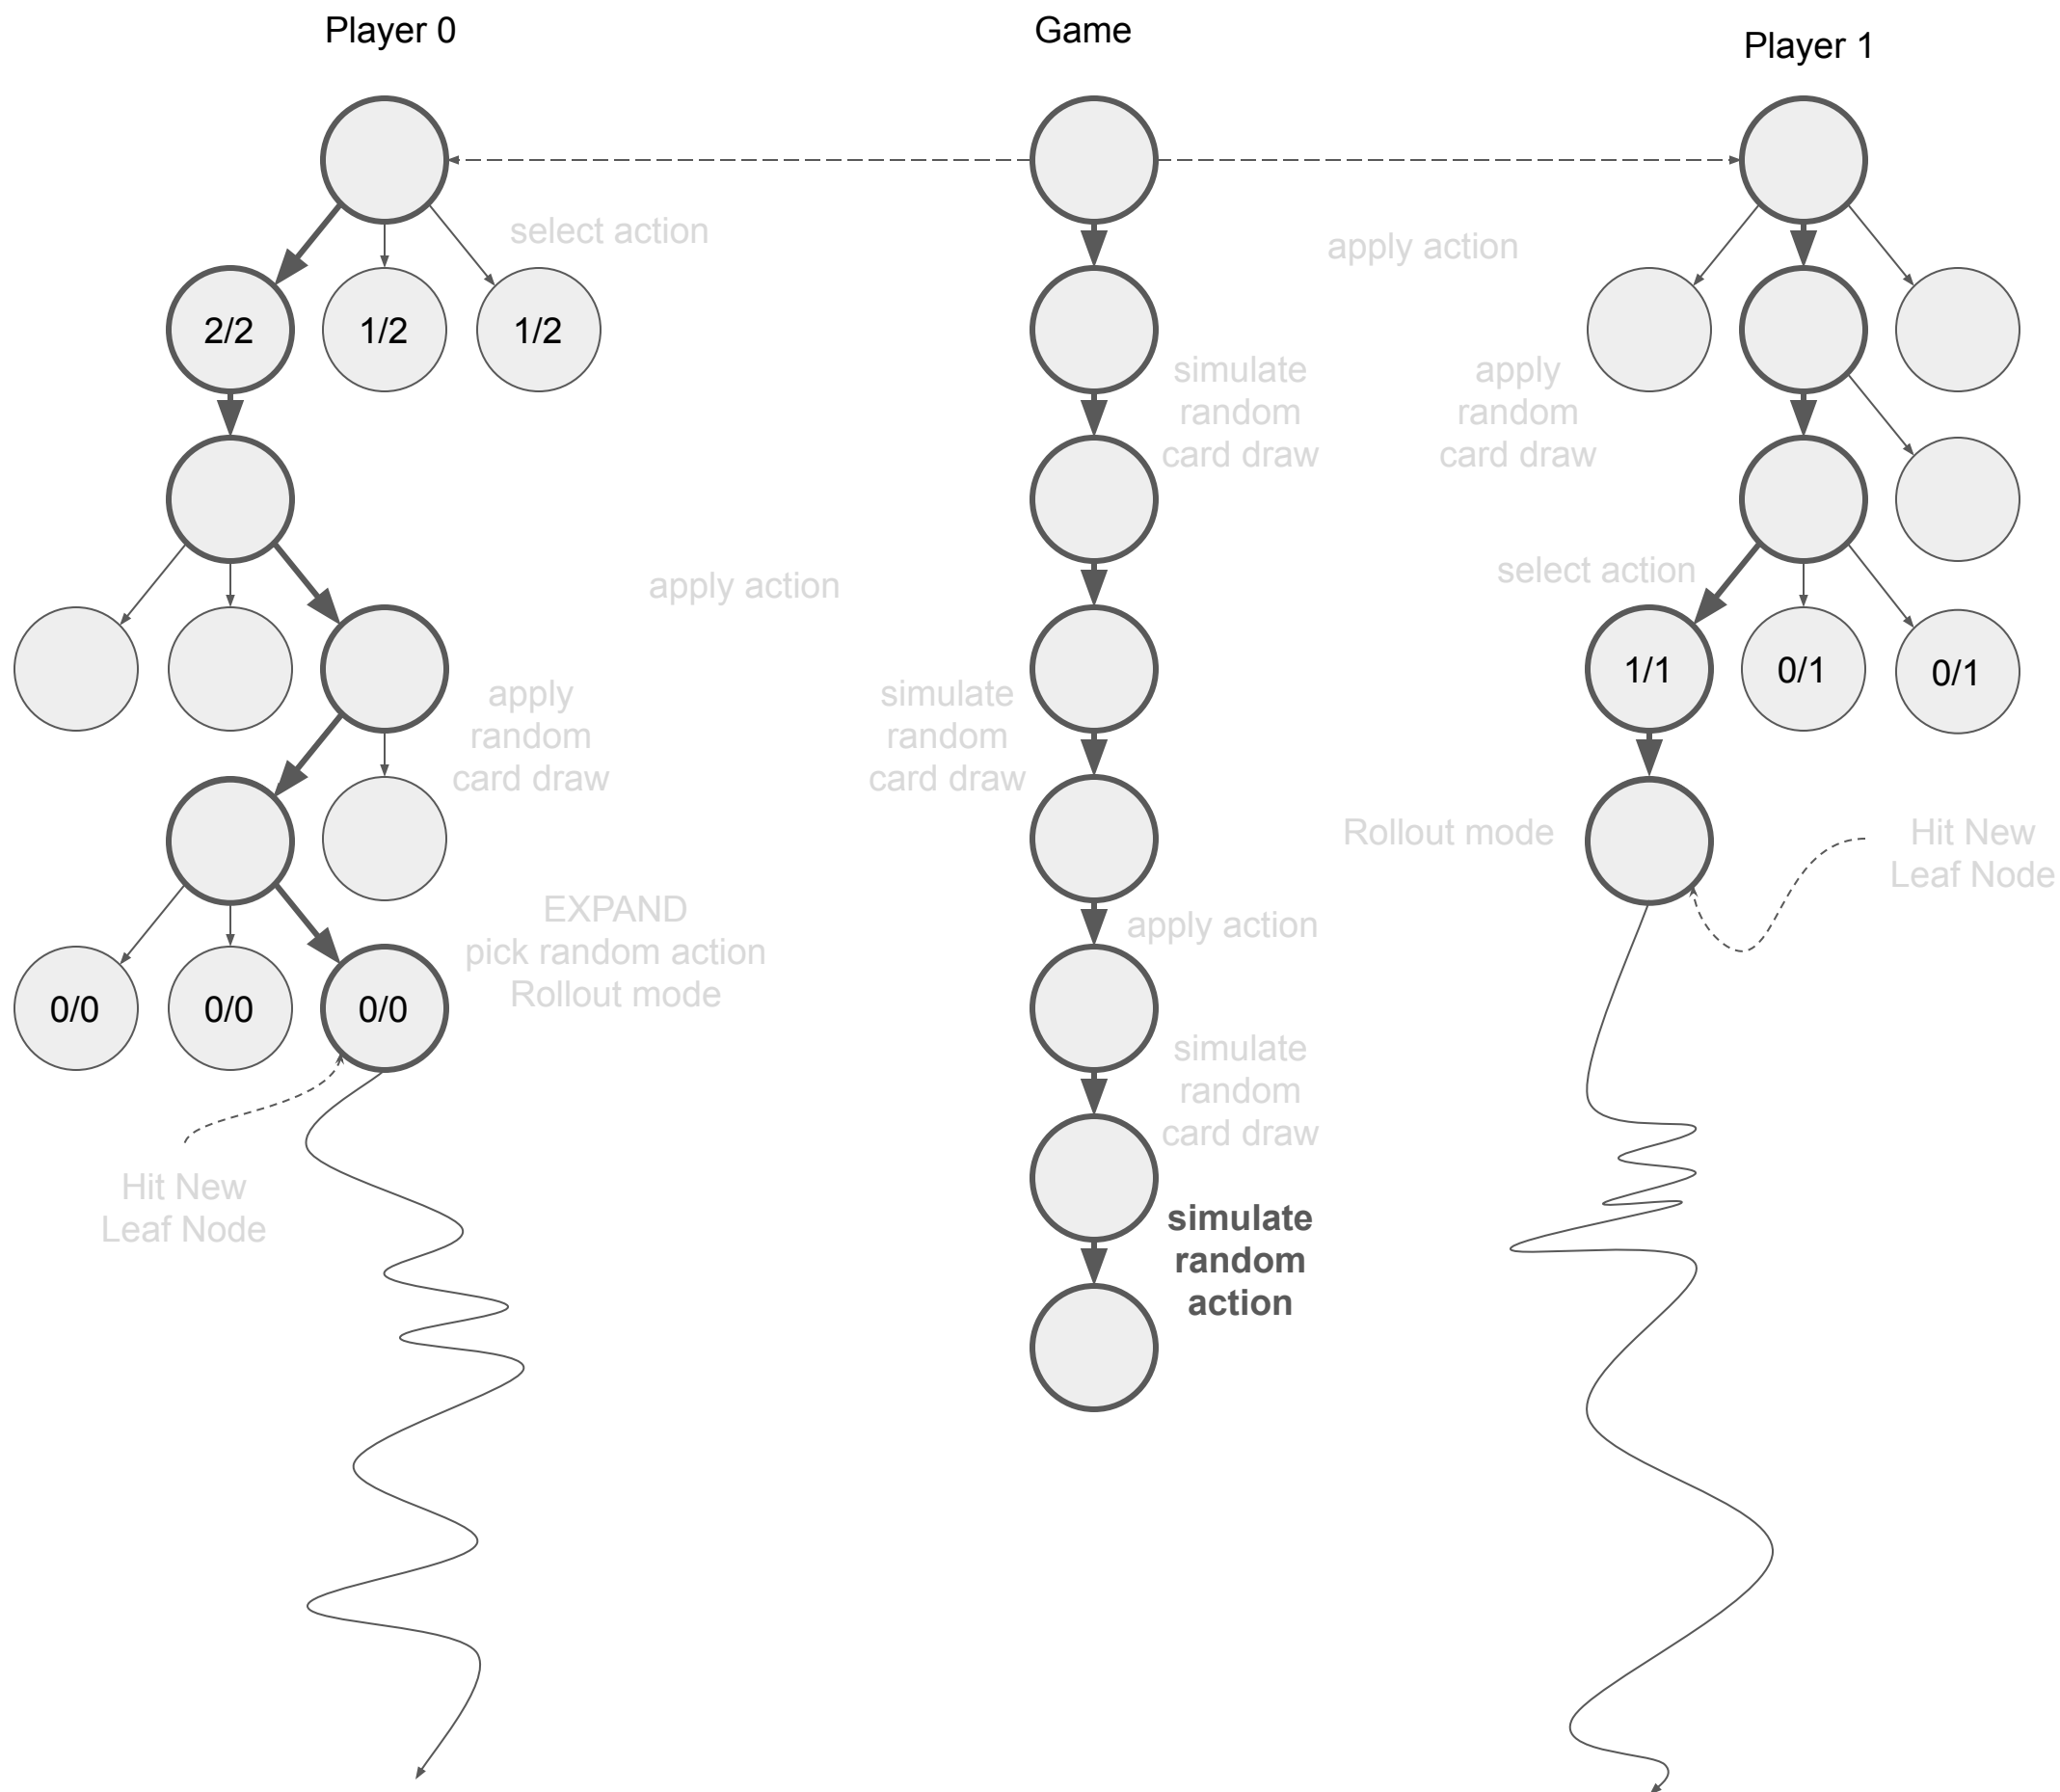

Simulate a random game

Simulate a random game

Simulate a random game

Simulate a random game

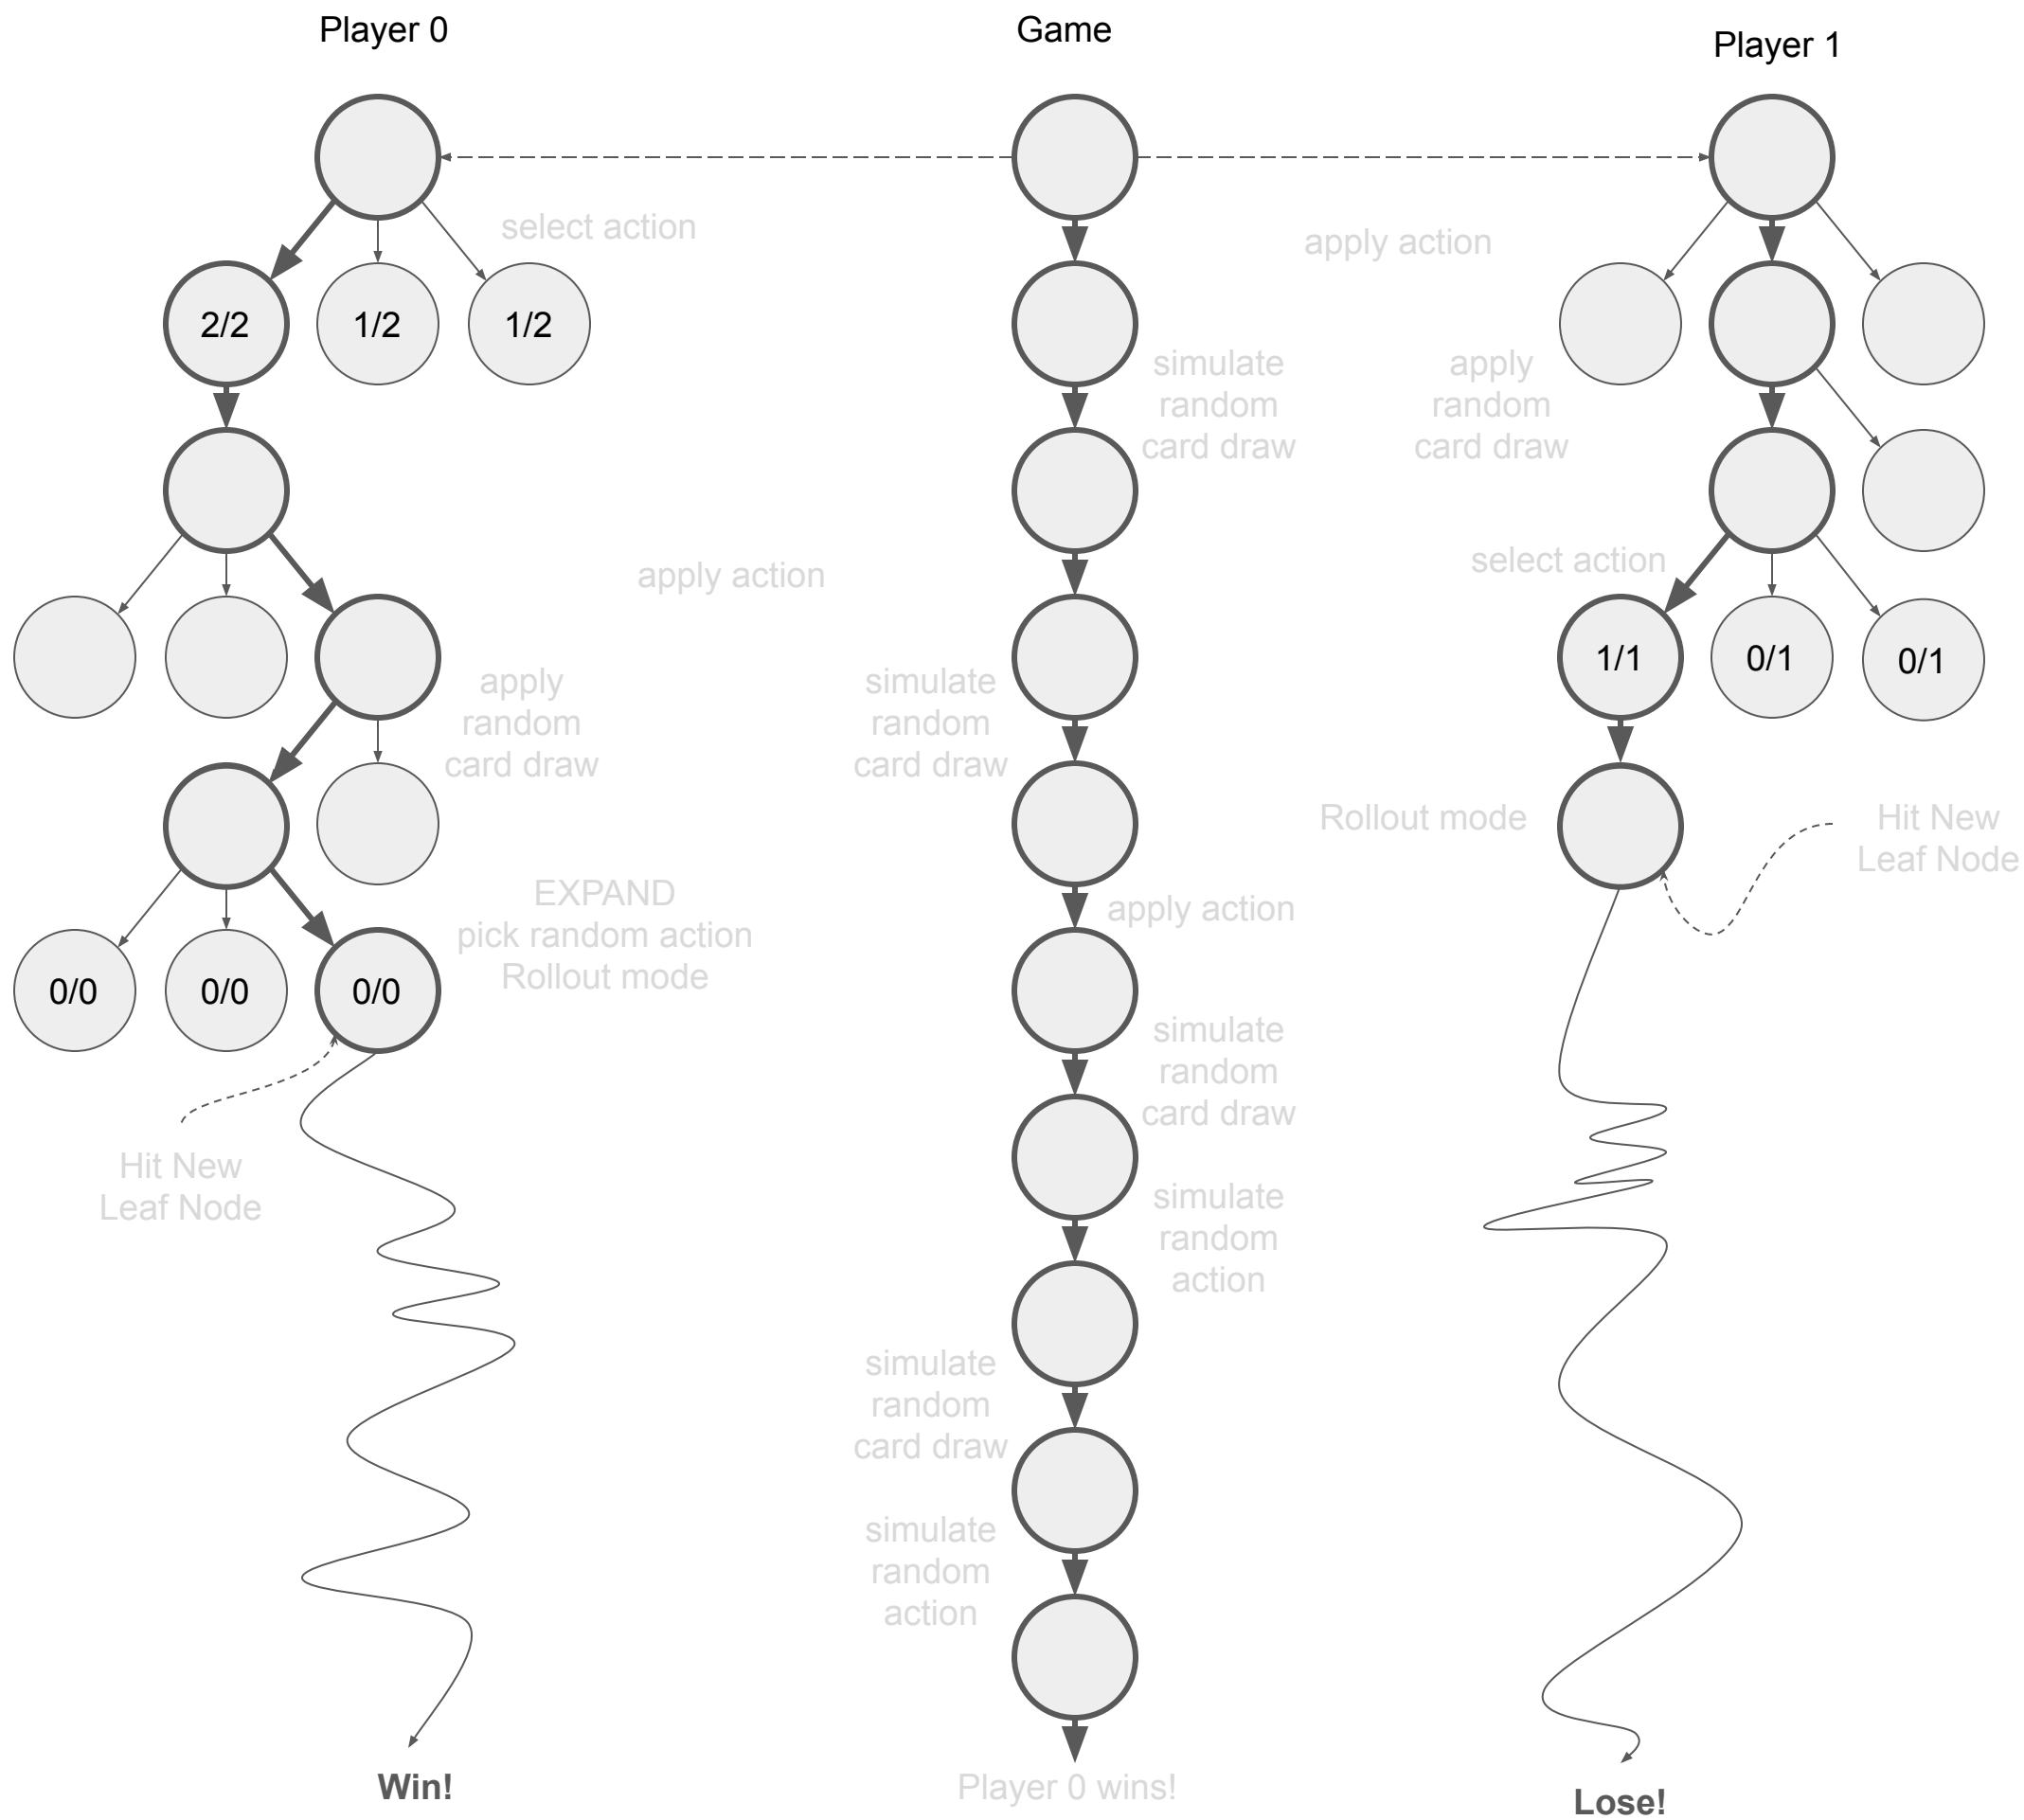

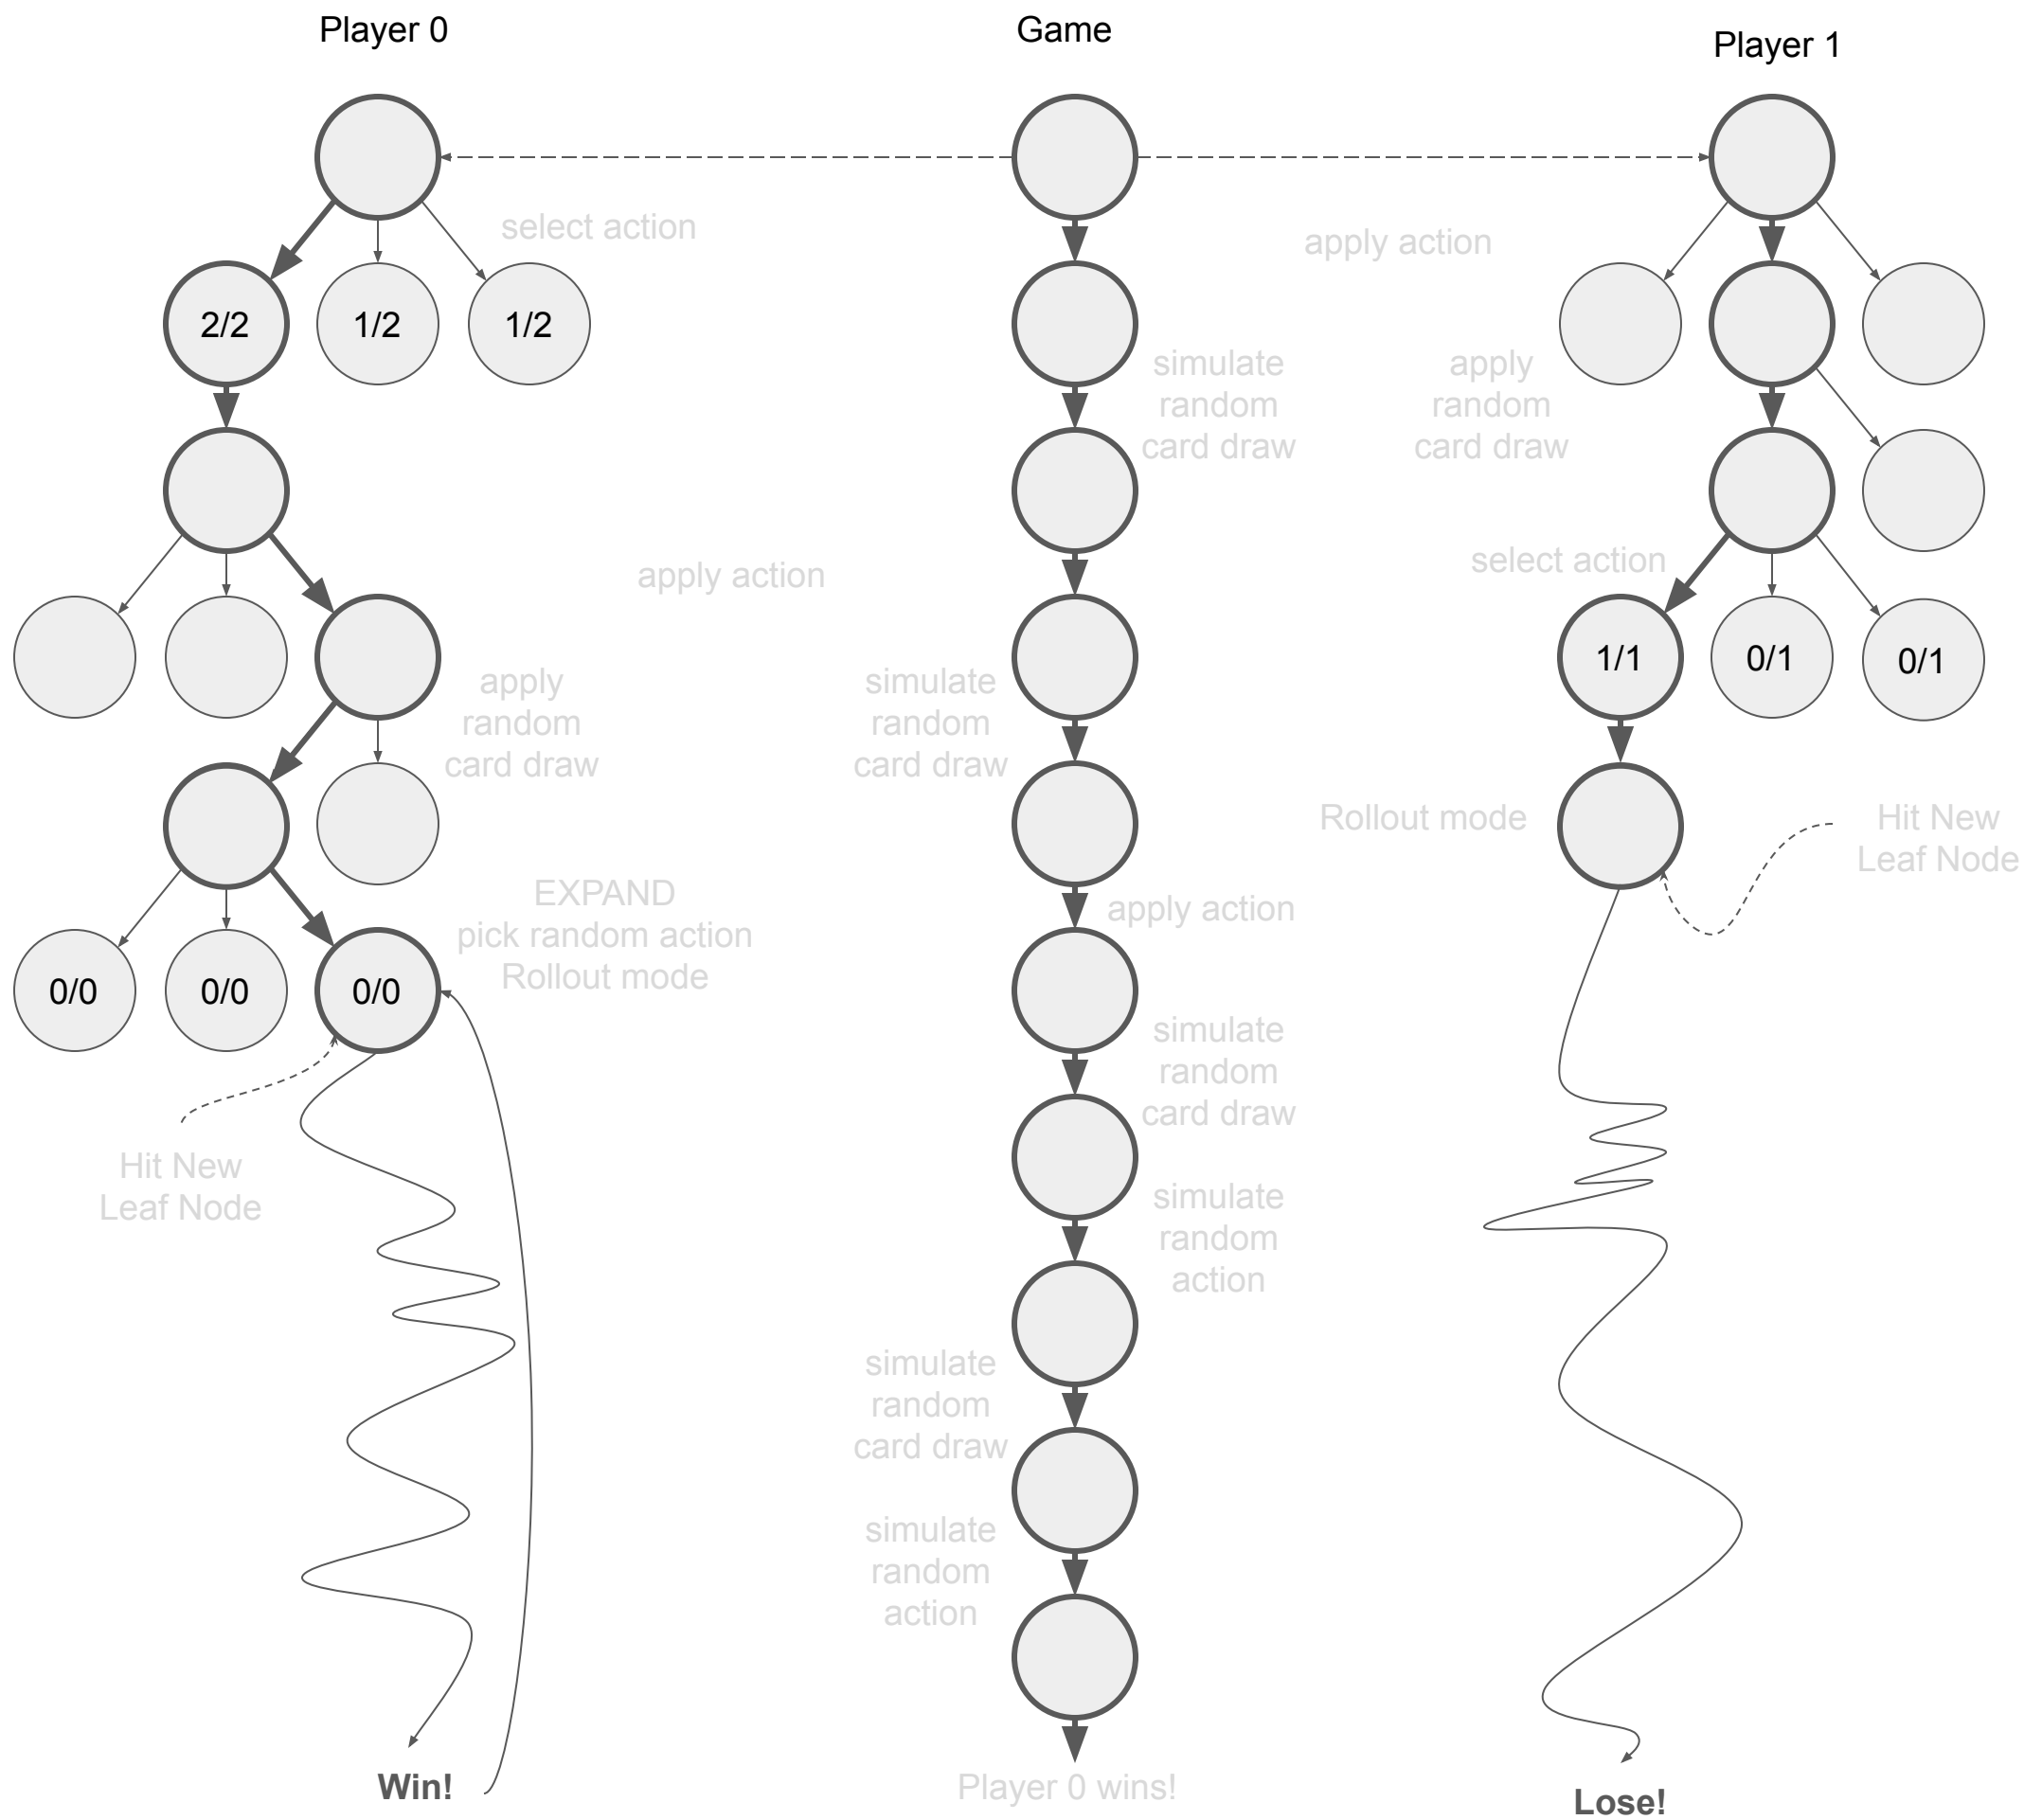

Simulate a random game

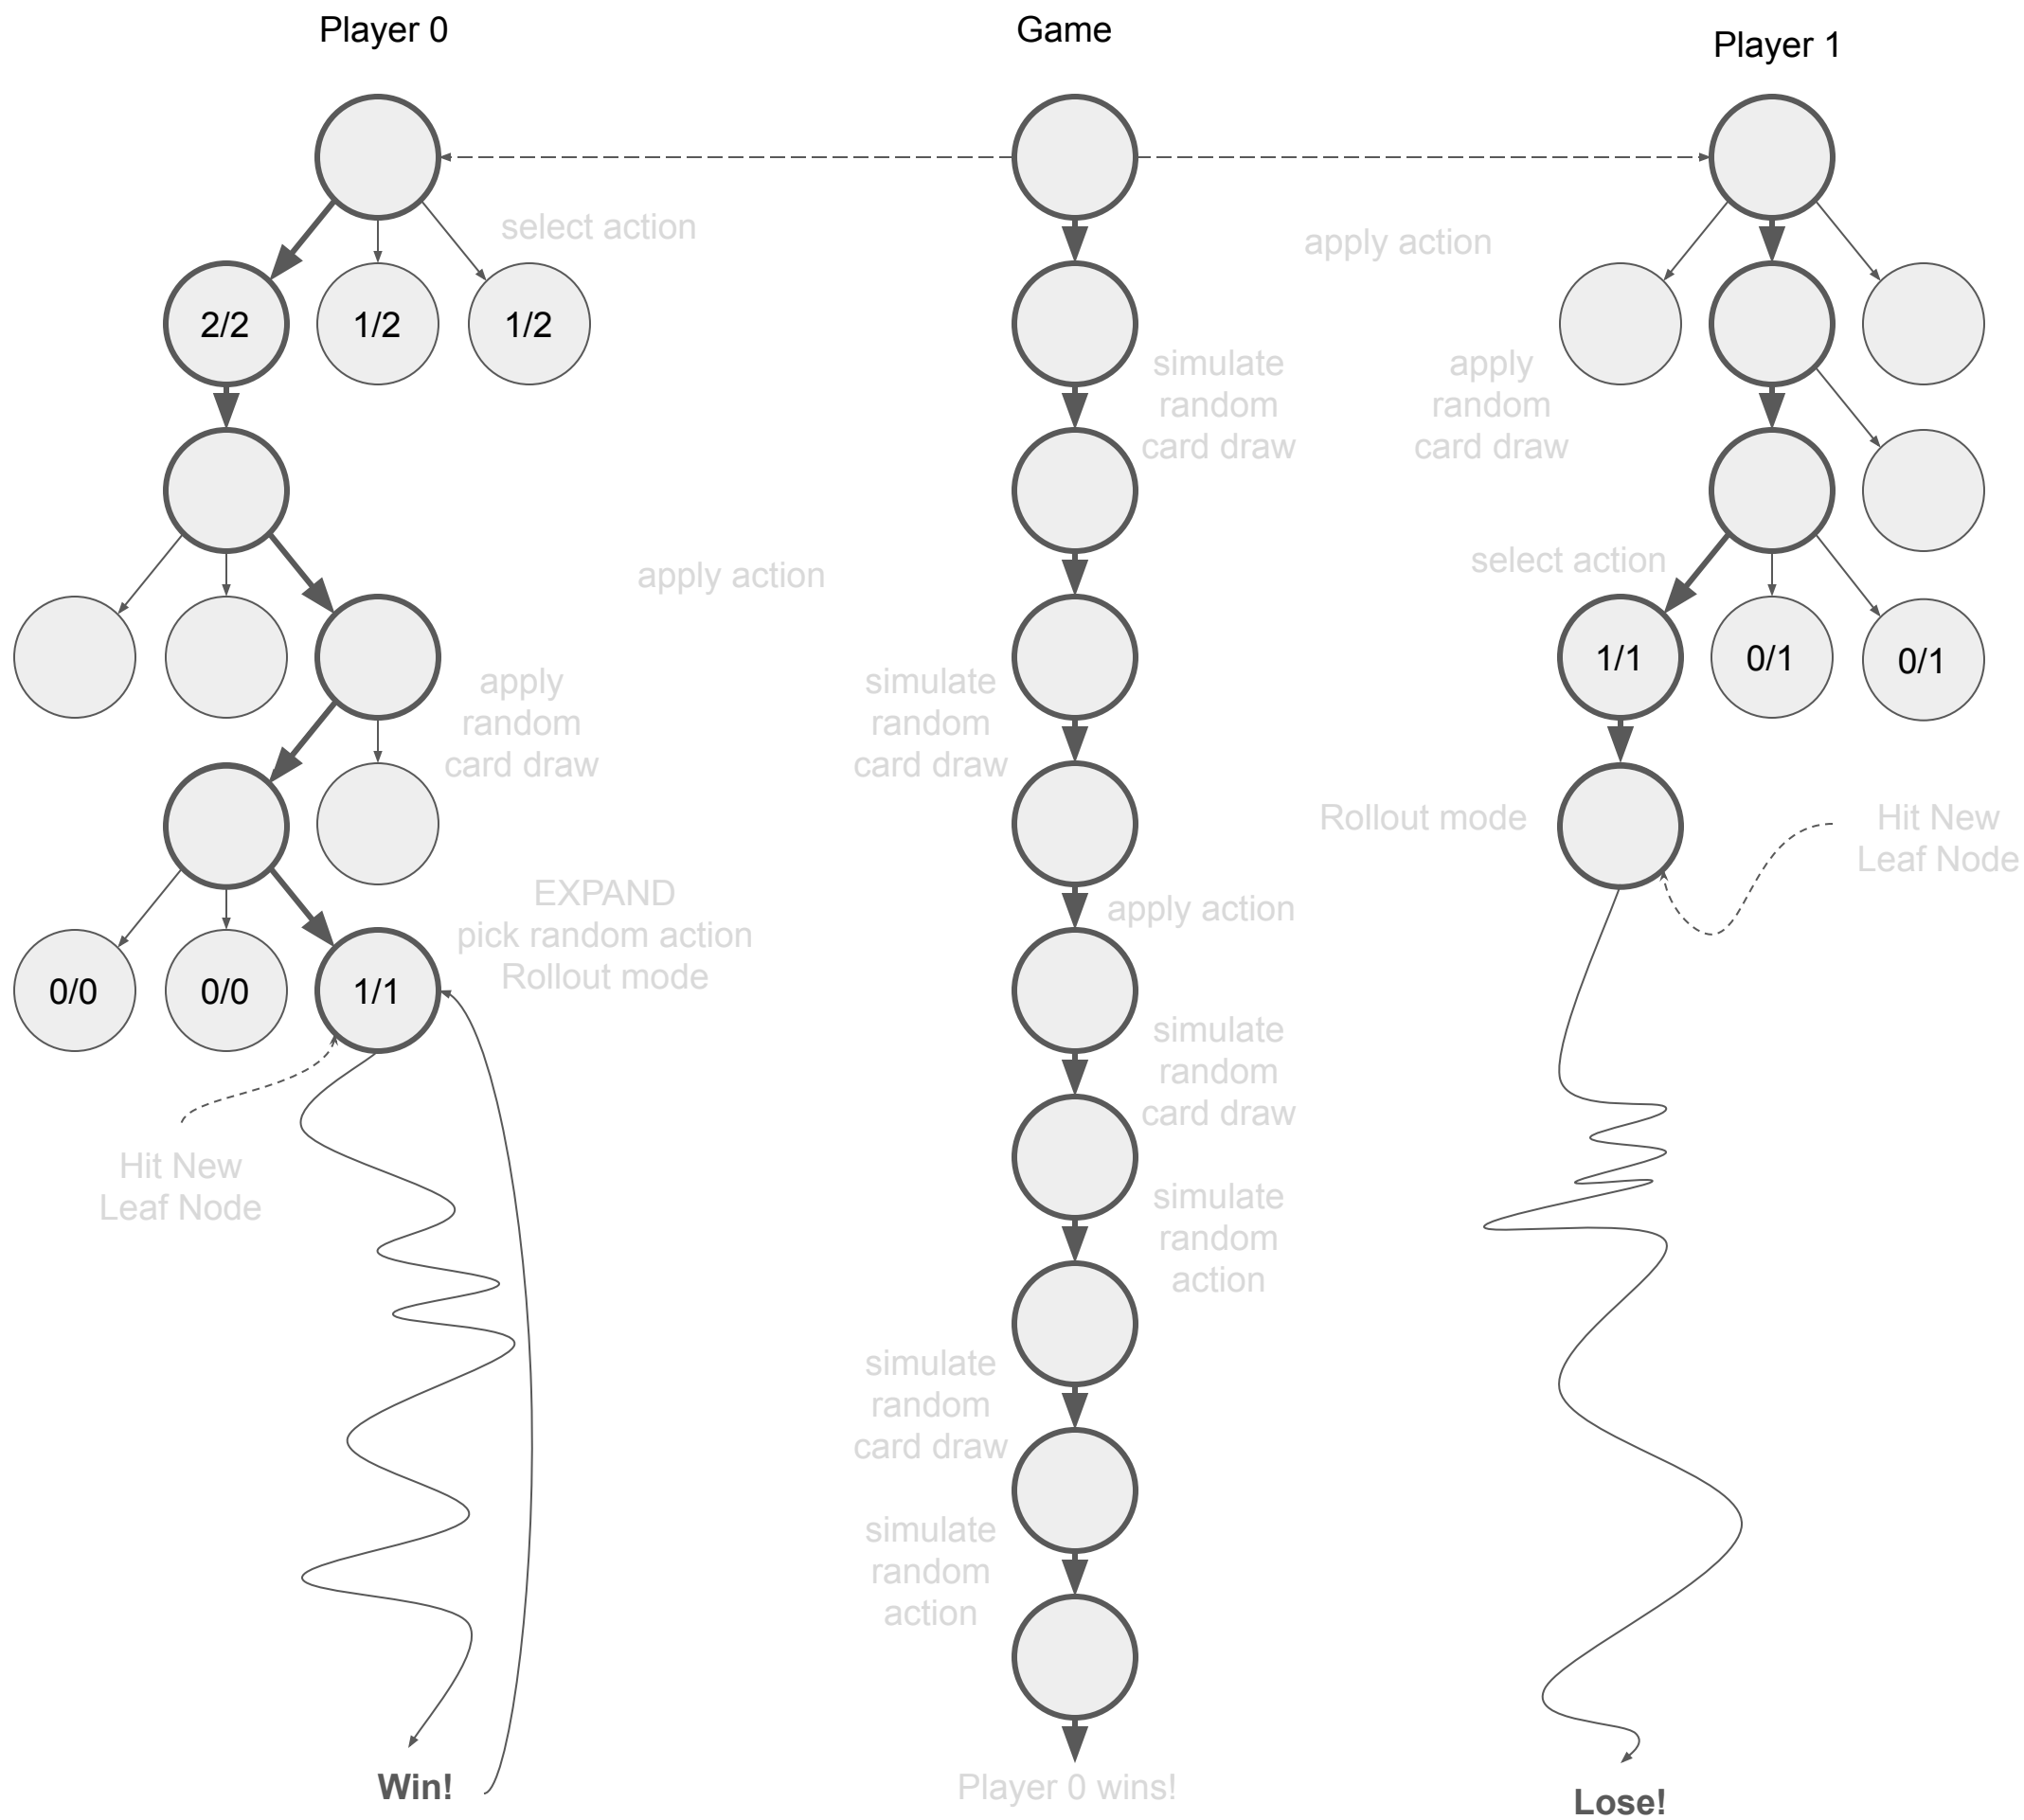

Simulate a random game

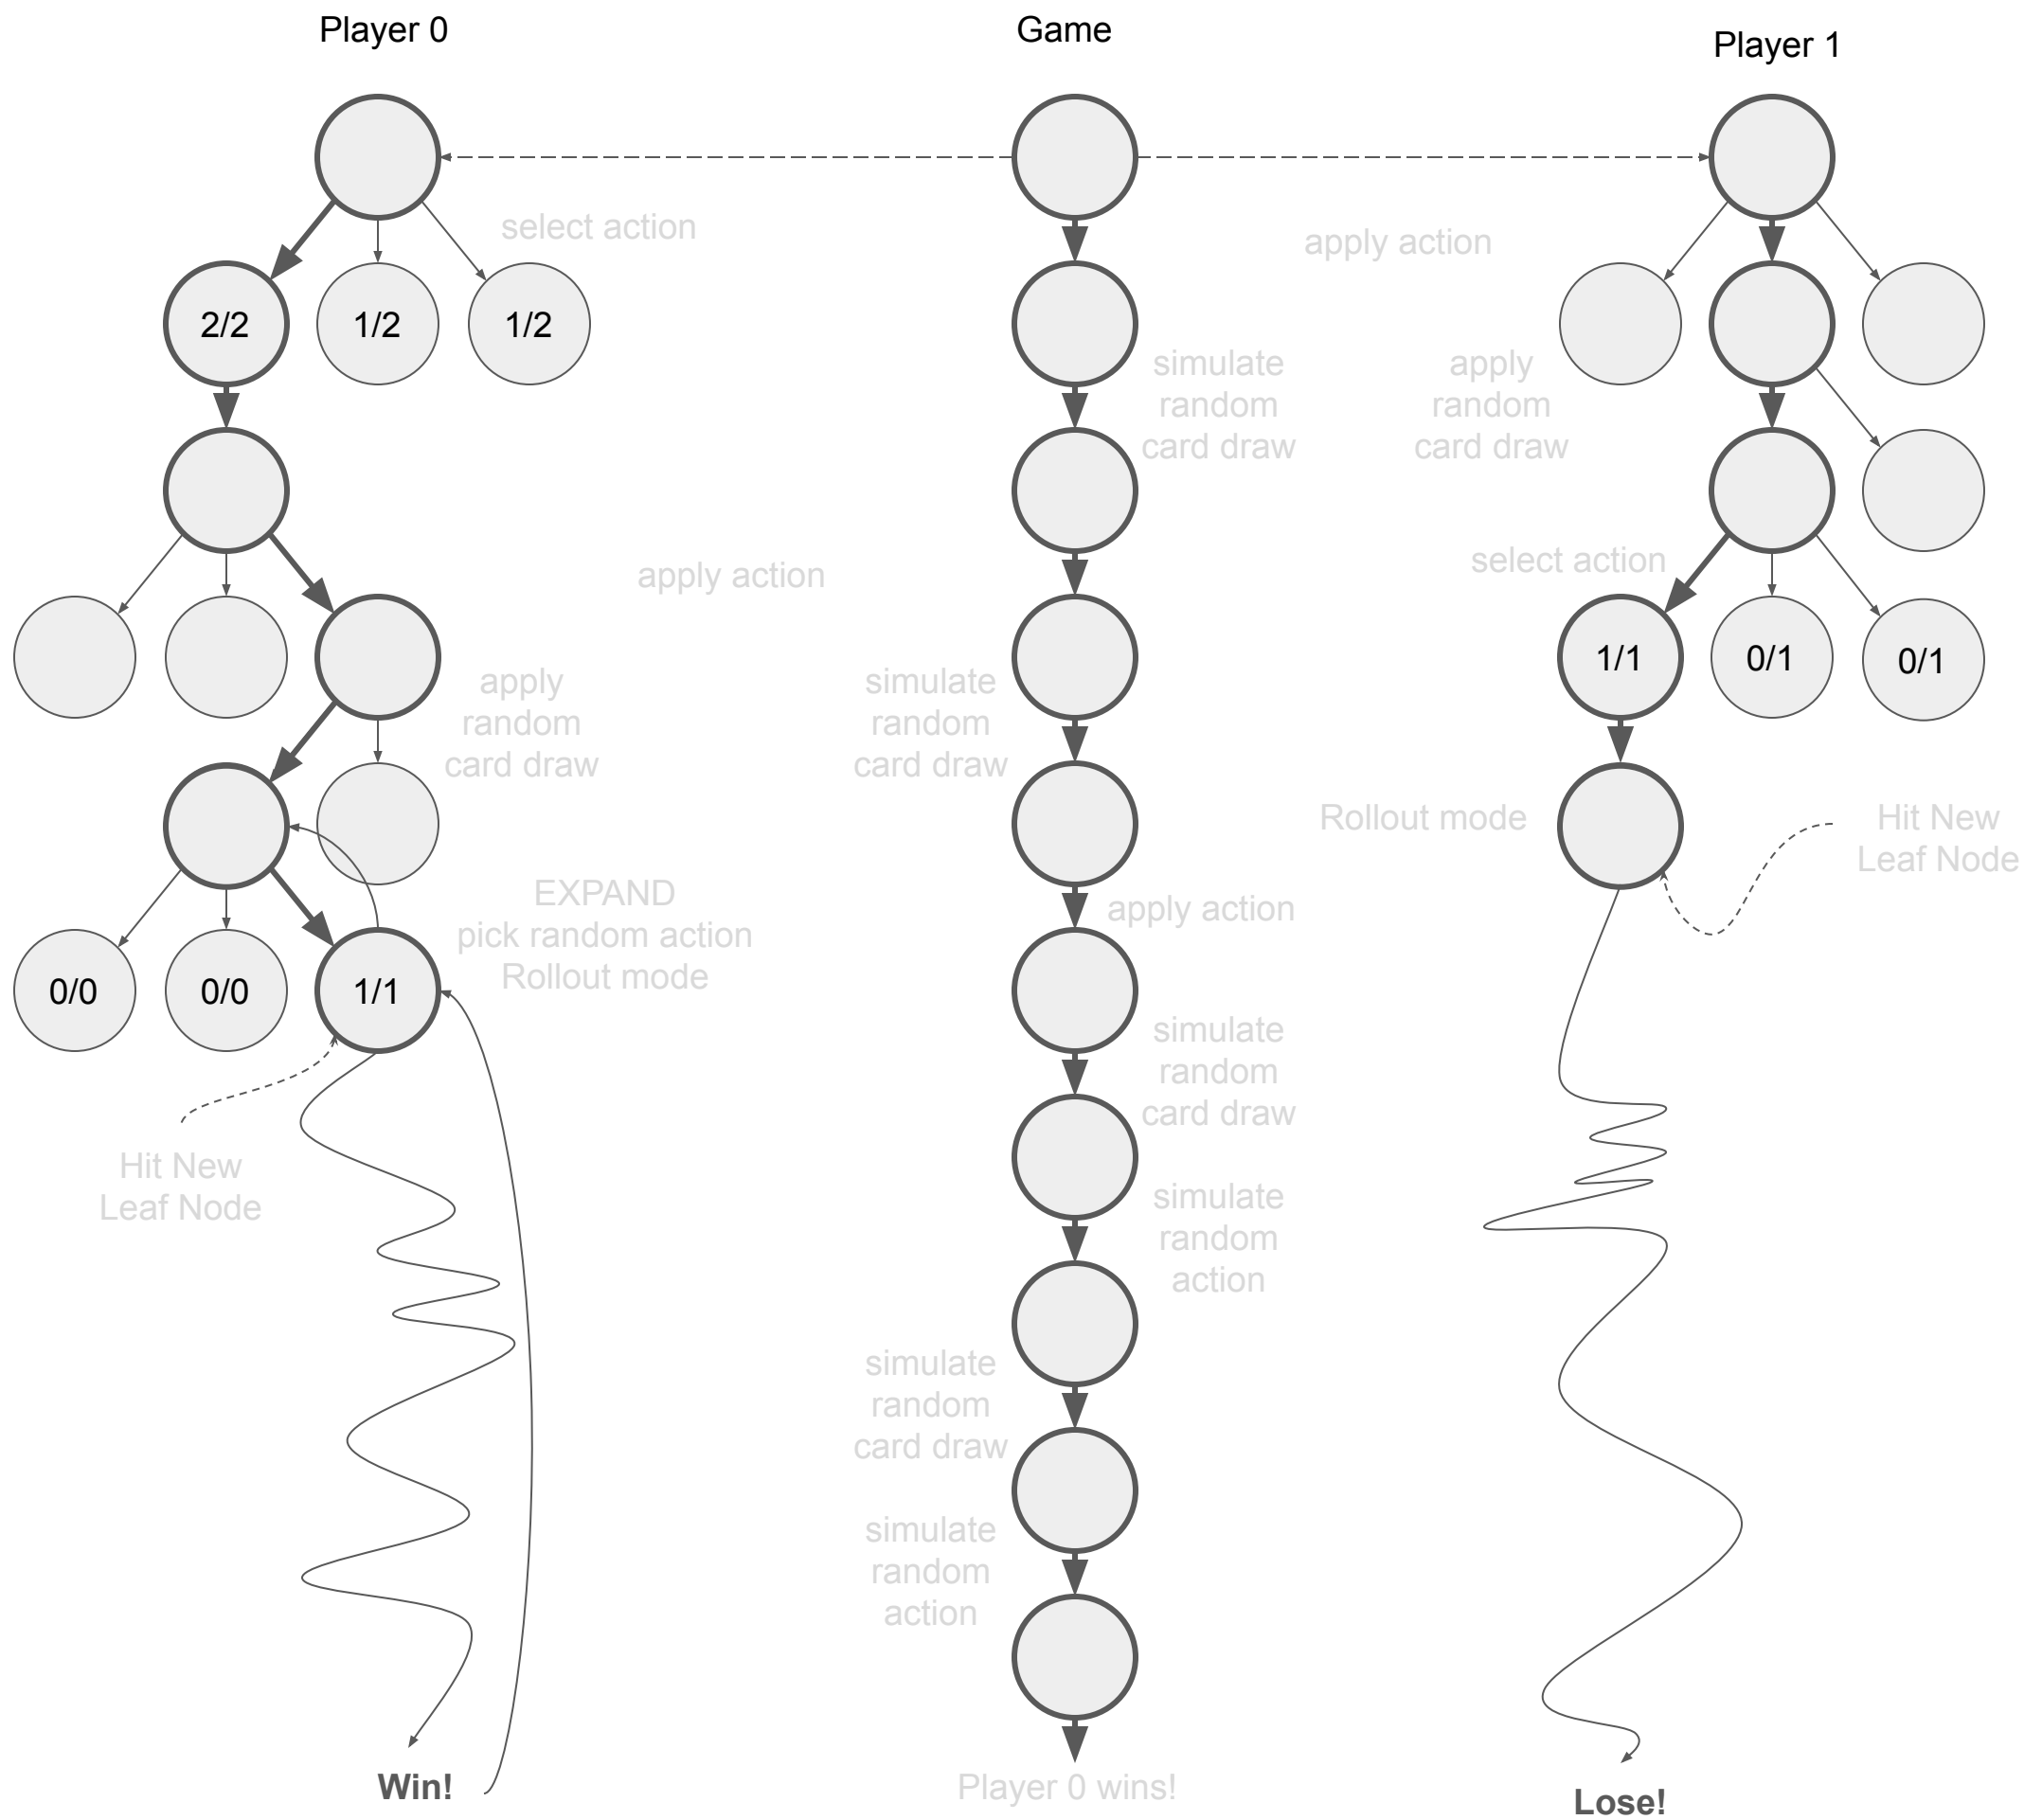

Backpropagate the win to the tree of player 0

Backpropagate the win to the tree of player 0

Backpropagate the win to the tree of player 0

Backpropagate the win to the tree of player 0

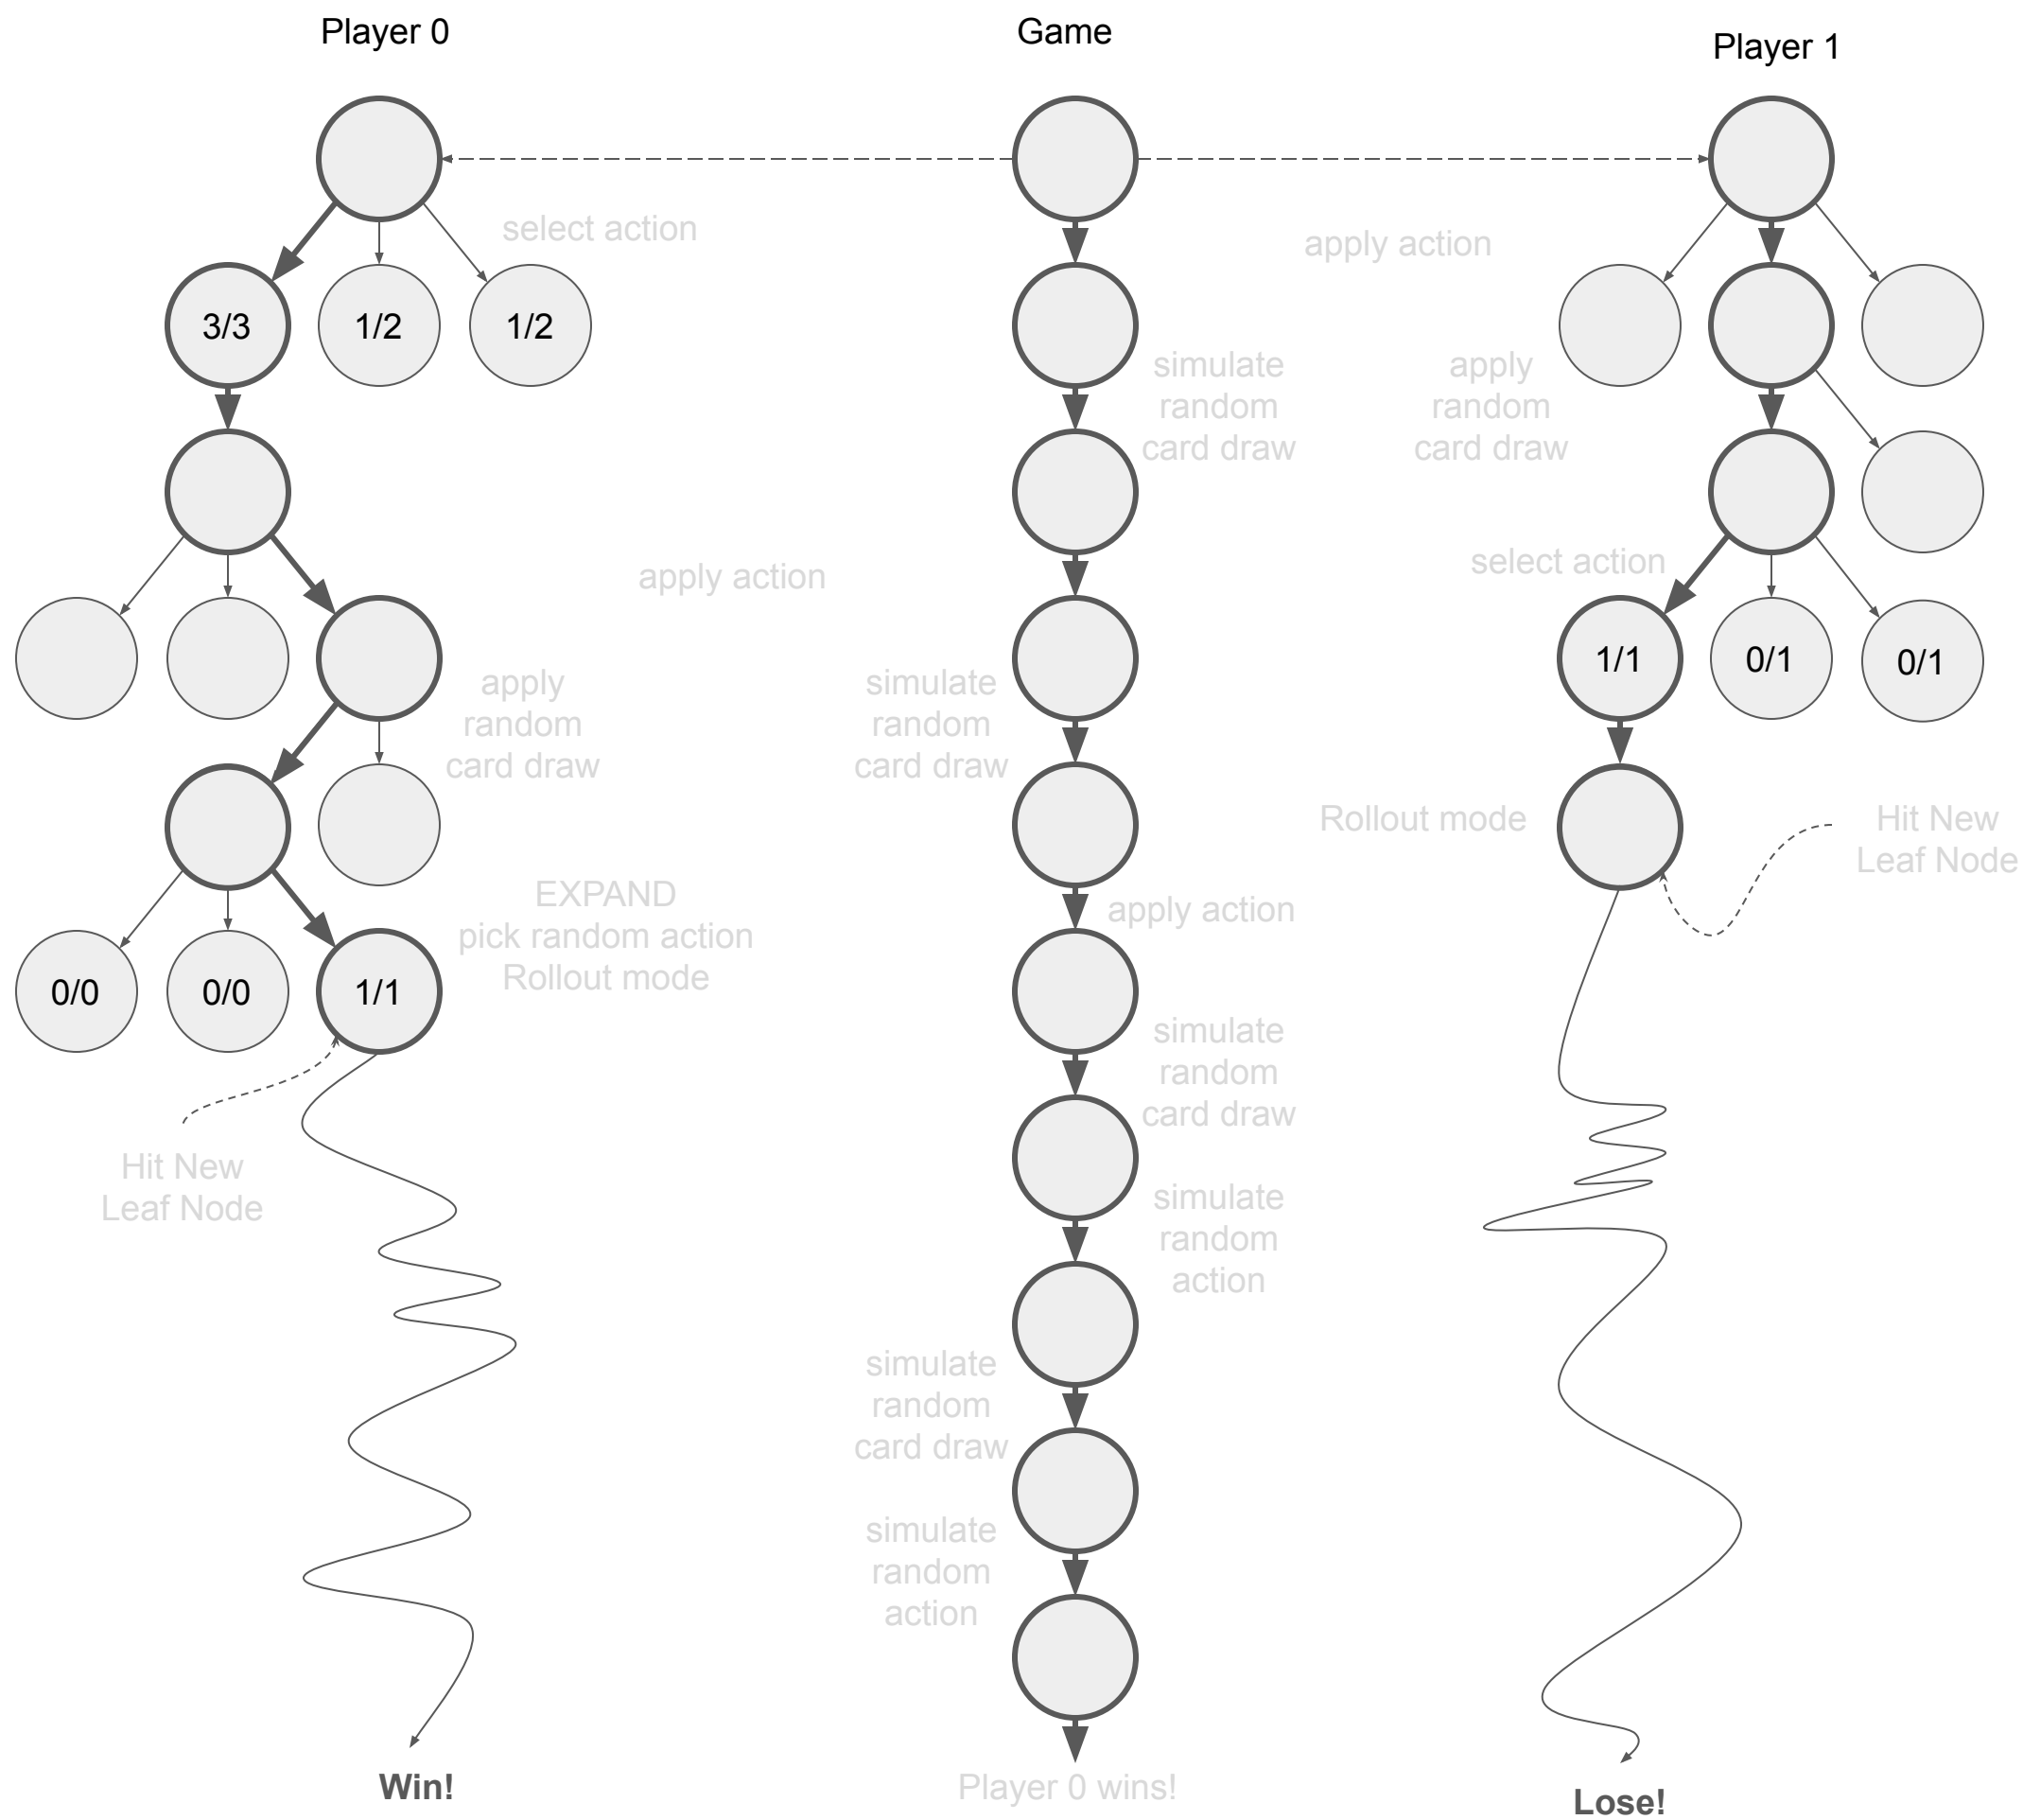

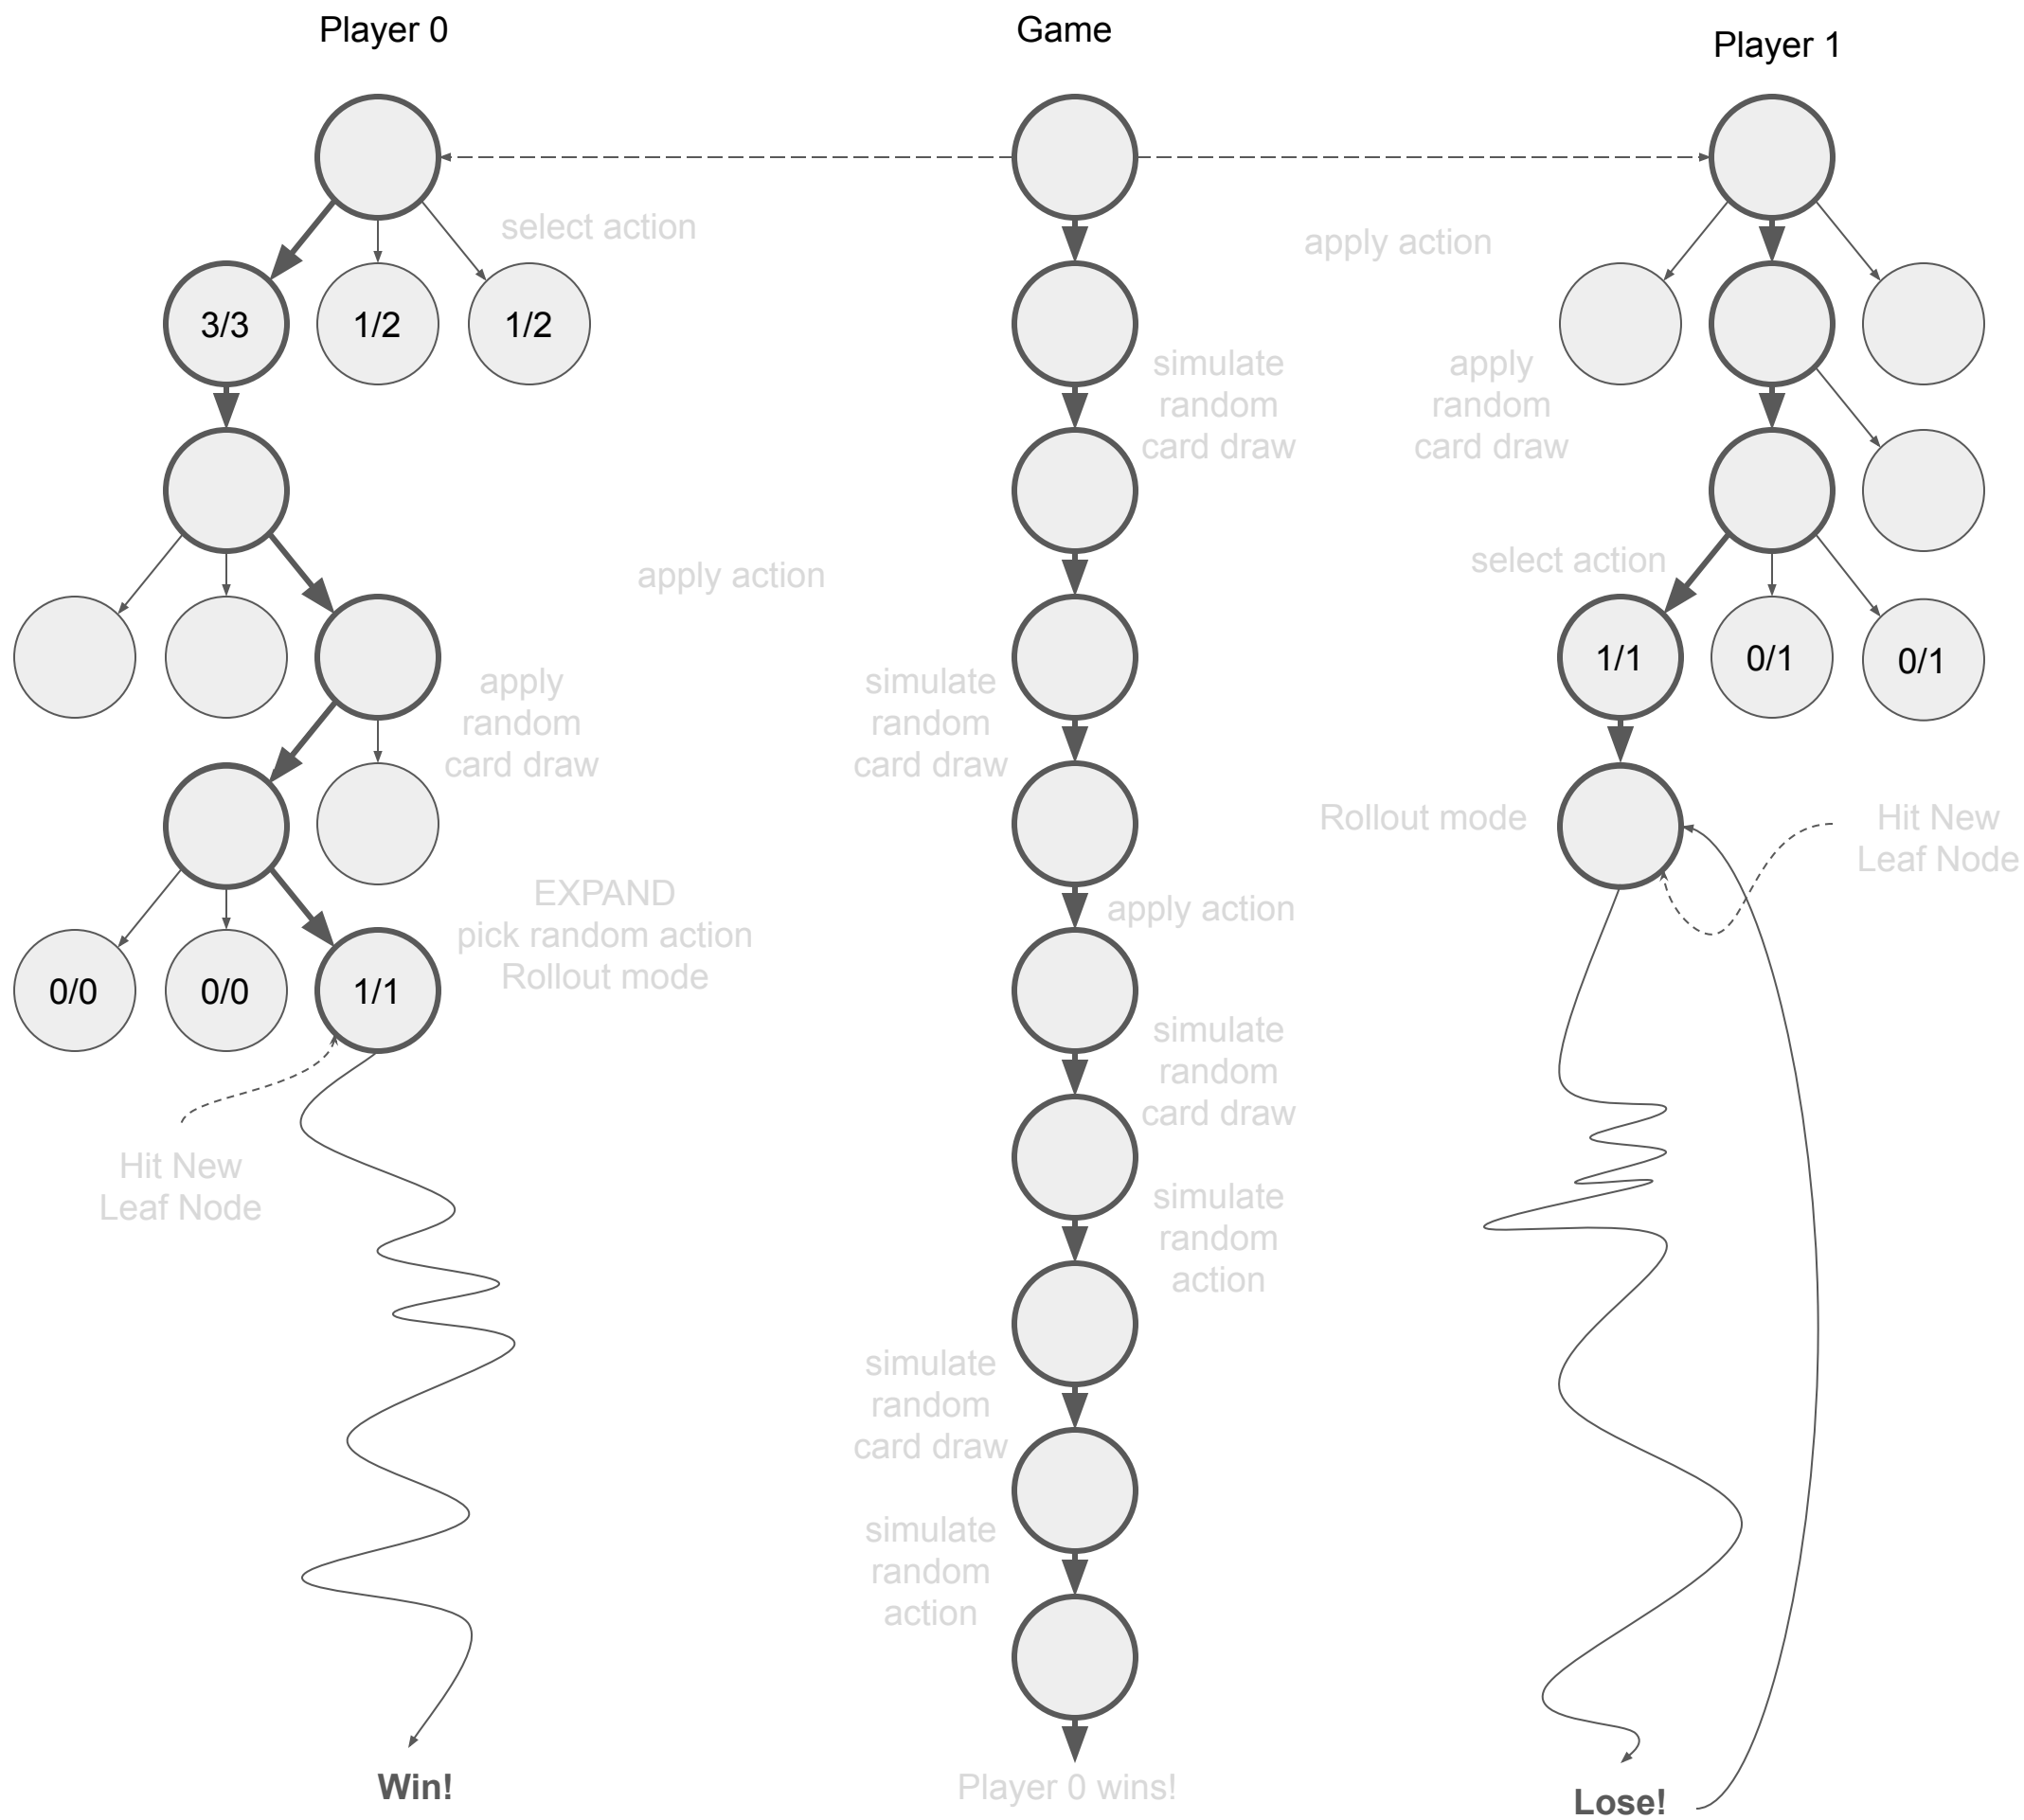

Backpropagate the win to the tree of player 0

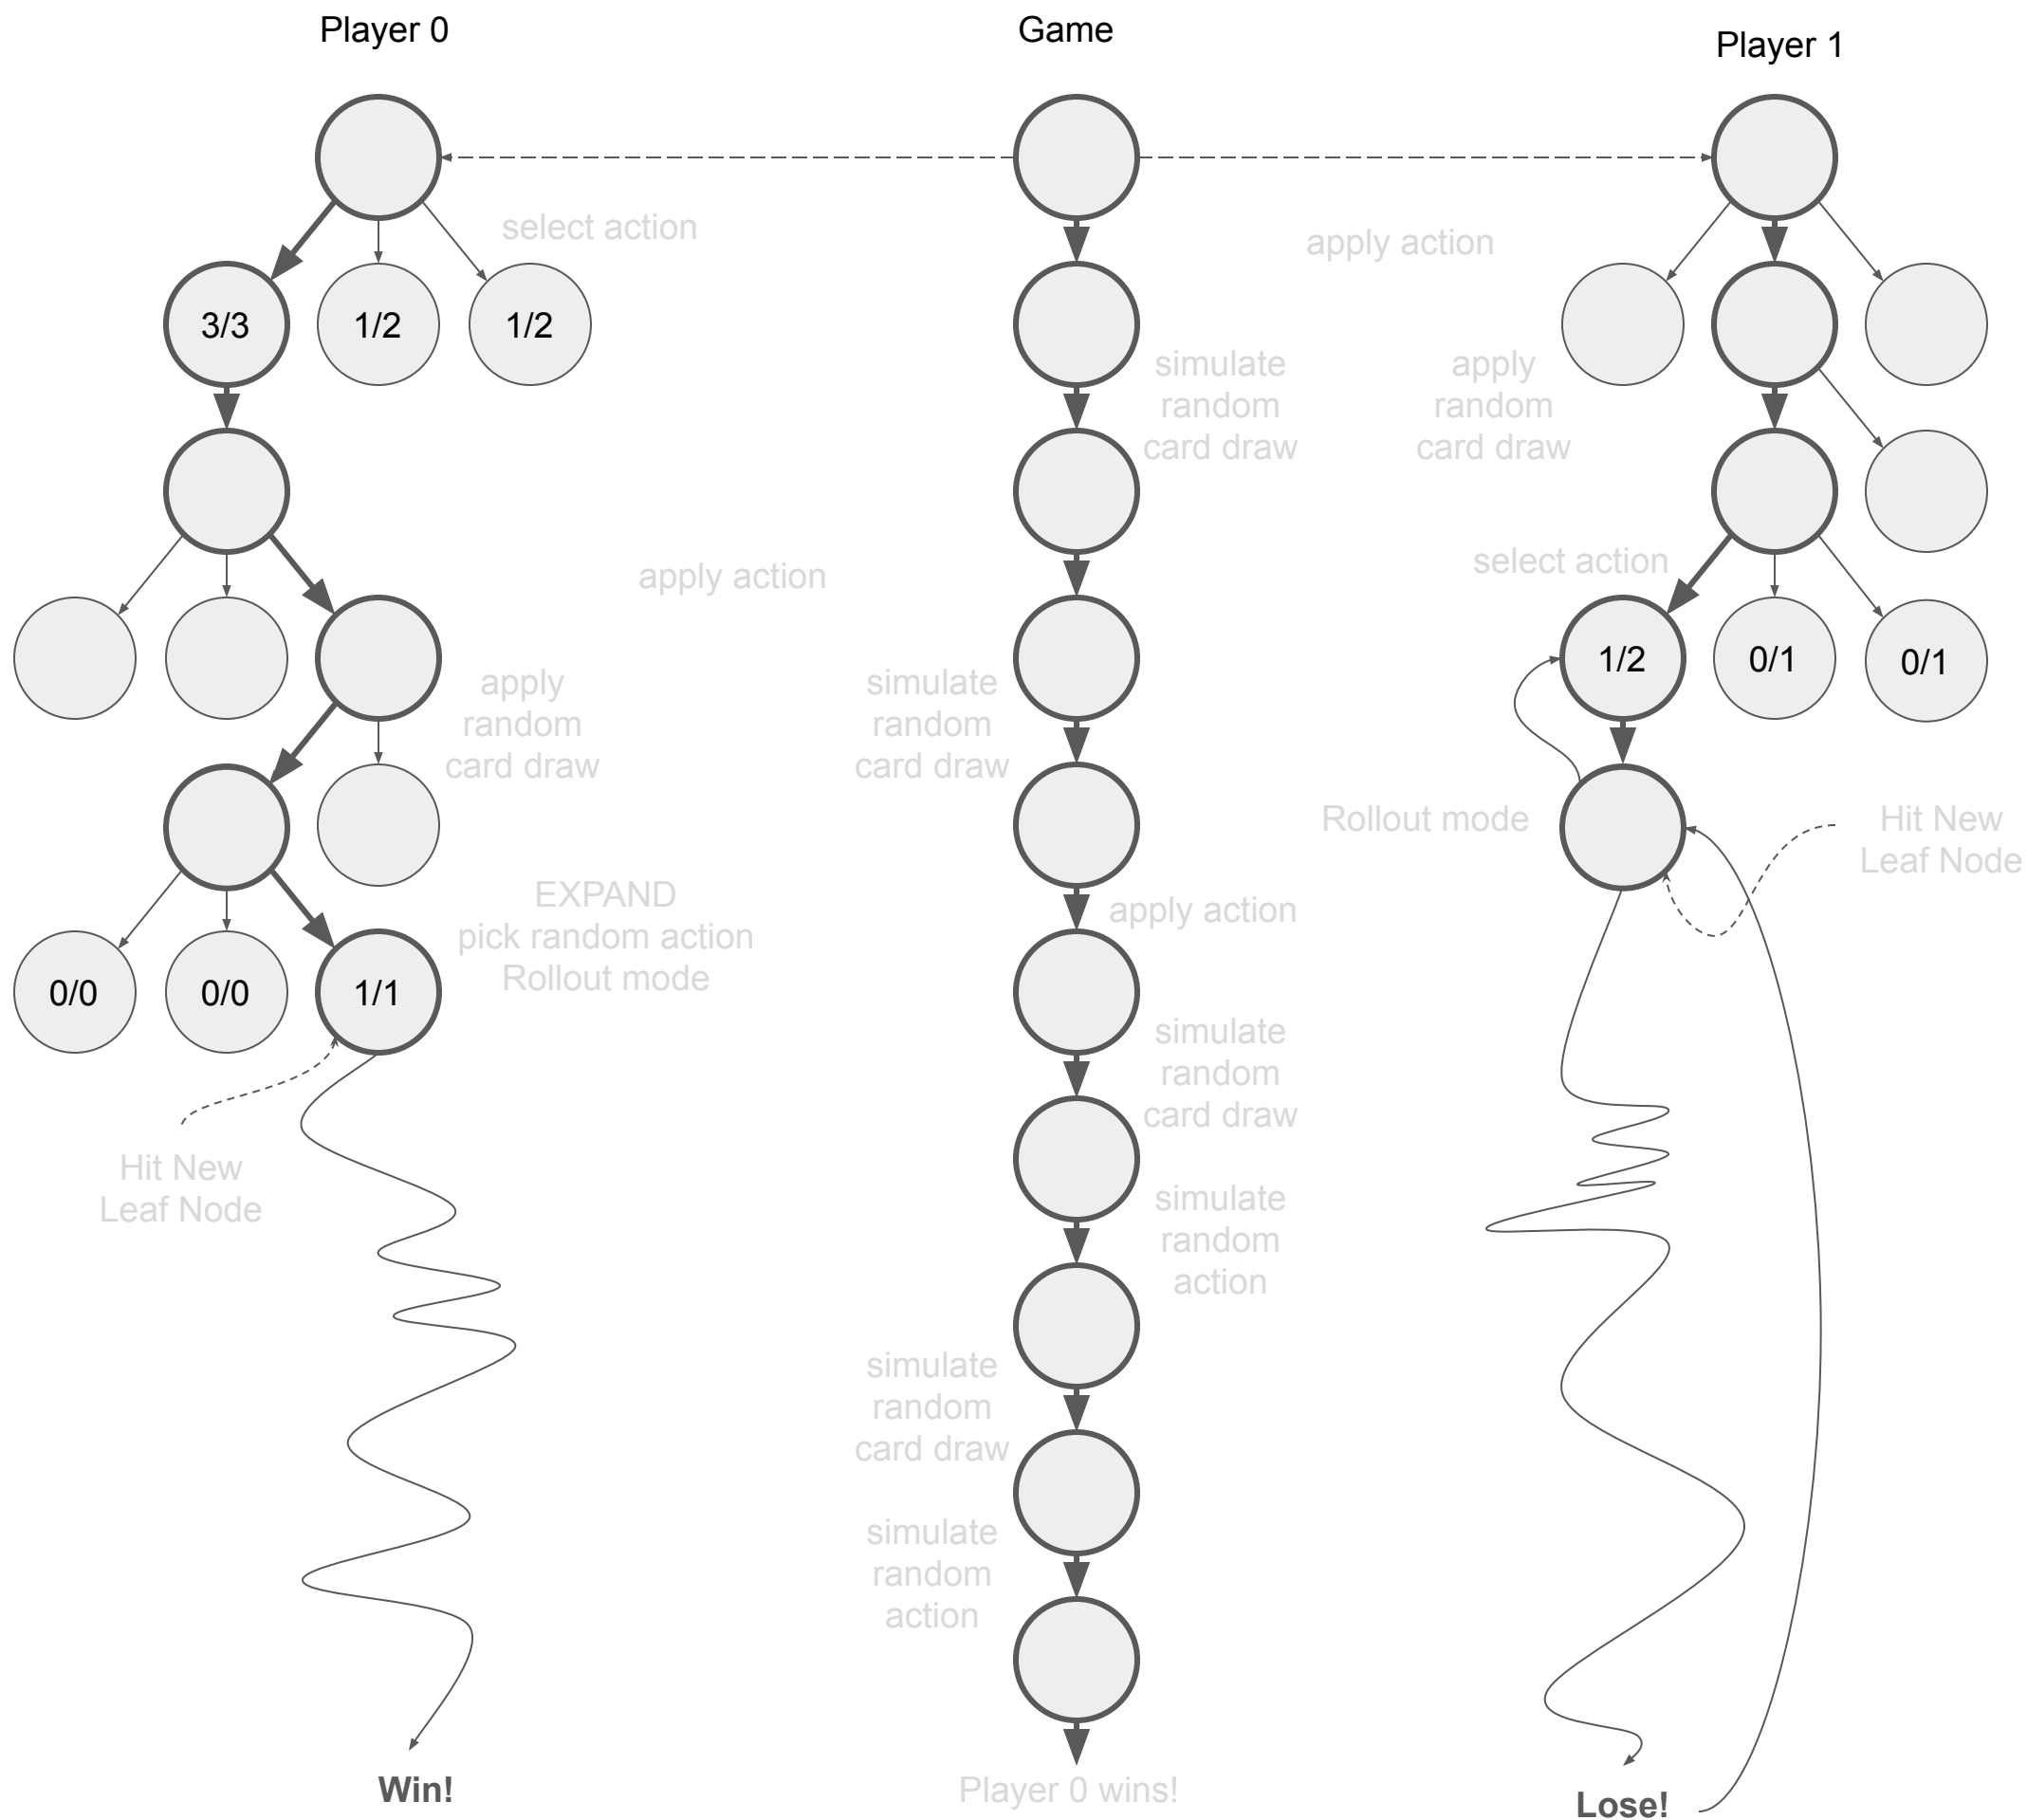

Backpropagate the loss to the tree of player 1

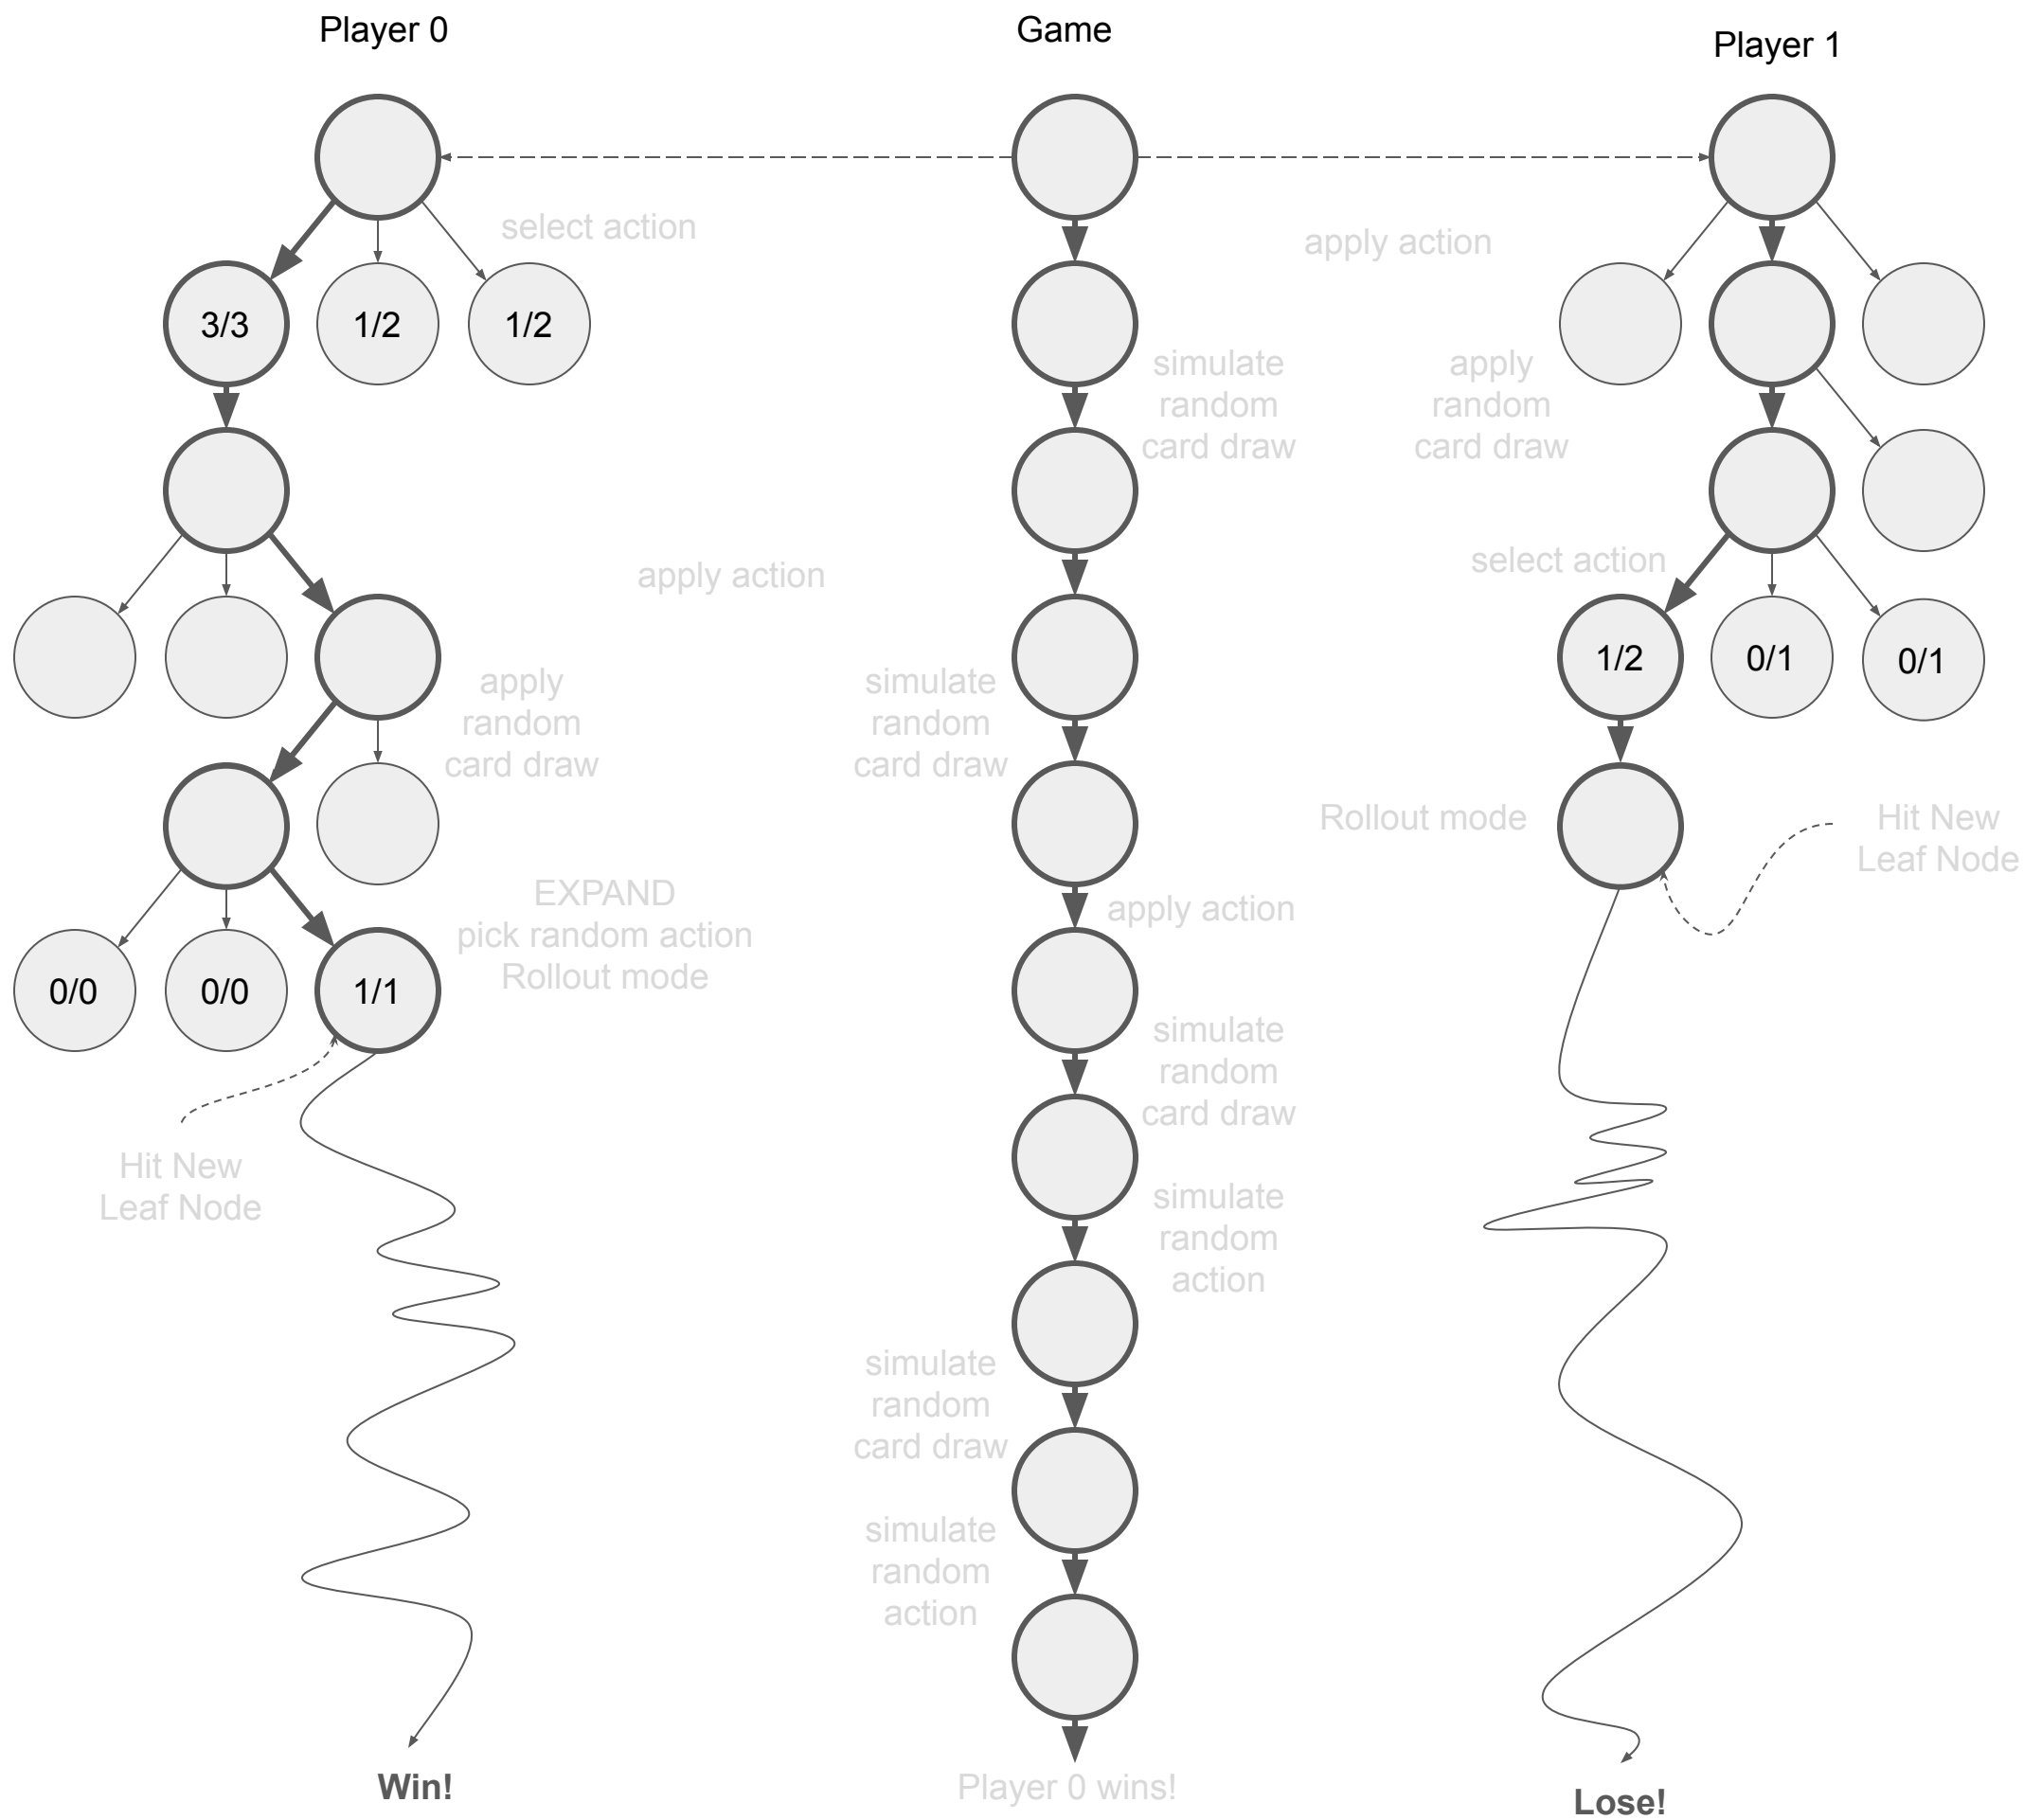

Backpropagate the loss to the tree of player 1

Backpropagate the loss to the tree of player 1

Repeat!
